# **AIML (Artificial Intelligence Markup Language) for Online Chinese Language Learning Assessment**

## **Abstract**

Are there relationships between Chinese language learners' asked questions while they are talking with a virtual robot and their Chinese language proficiency as well as other relevant information such as their psychology, their self-confidence, their interested complementary, supplementary information etc.? How to use them to correctly detect learners' language proficiency and all related information if the relationships do exist? The thesis is going to identify these relationships; test these relationships; find the causation of these relationships; explore the implementation of using these relationships.

The researcher used a hybrid of quantitative, qualitative, case study and classical 'positivistic' design with which 30 Chinese language learners were selected as micro cases and the relationships between their asked questions while talking with a virtual robot and their Chinese proficiency as well as their psychology, their self-confidence, their interested complementary, supplementary information etc are identified, tested, their implementation explored.

So we may use Chinese language learner's asked questions while they have a free conversation with a virtual robot to correctly detect their Chinese proficiency level, their psychology, their self-confidence, their interested complementary, supplementary information etc. according to the t test of the researcher's sample statistics. This is efficient, because learners asked questions are the questions they really want to know from their free will without extra time required for a formal survey and assessment.

# 1. Introduction

The goal of this thesis is to develop and evaluate a method to assess Chinese language E-Learners' knowledge and their interests in different online courses by analysing pattern in question asking. The general idea pursued rests on an analysis of co-occurrences of questions. It works by identifying association rules based on logs of questions collected in a dialogue system (e.g., implemented on the basis of AIML).

For instance,

“If a student asks question A, there is a probability of .12 that he/she also asks question B.” From a more formal point of view, we may conceive of these relationships as association rules.

This approach has much in common with an analysis of cross-selling patterns well known in shopping basket analysis. For instance, if you have ever gone to [www.amazon.com](http://www.amazon.com) to buy something (books, CDs, etc.), clicking on the book you interested you would find that the website also offers you the information that customers who bought the same items also bought what else; customers who viewed the same items also viewed what else; customers' reviews about all related items; producer's reviews about all relevant products; expert reviews of all items related; current customer may add their own reviews. The relating products may also be further classified into vertical related, horizontal related, complementary, supplementary etc. These are helpful for people to make informed decisions about whether to buy this products or not and for people to know what are the related products in this area. This idea may also be applied to E-Learning.

The method used in this project is based on the AI – artificial intelligence theory. The key ideas are to create a chat robot in the website – <http://pandorabots.com/botmaster/en/home> by using AIML – Artificial Intelligence Markup Language. A chat robot is a natural language character that communicates with clients, or people chatting on the web, instant messenger, email, usenet, web forums, or even through voice communication such as the telephone. There is a long list of killer applications of chat robot technology such as: Adult Entertainment,

Teacher Bot etc. Mine is going to be a FAQ Bot - Answering the questions asked by online learners; collecting, classifying, analysing, validating and testing all the questions and analytical results.

The AIML is designed to be as easy to learn and use as HTML – Hyper Text Markup Language (the basic language used to create all web pages). AIML, or Artificial Intelligence Mark-up Language is an XML-based programming language. It was designed specifically for the creation of the A.L.I.C.E. chatterbot. Although with broad usability potentials, the language is more suitable for the producing of natural language software agents, known as Alicebots. AIML contains several elements. The most important of these are described in further details below.

### Categories

Categories in AIML are the fundamental unit of knowledge. A category consists of at least two further elements. These are the pattern and template elements, which are usually coded in that order. However, this is not a necessary programming syntax.

### Patterns

Alicebots are generally described as 'pattern-matching' chatbots. This means that the program will search for patterns within a user's input and respond accordingly. The pattern element defines the pattern that will be searched for, hence its name.

### Template

If a pattern within a category is matched successfully and it is the most accurate pattern that can be matched, then the category-specific template is applied to the chatbots response. This template can contain other AIML elements, which allow automated customisation of the chatbot's response.

The website Pandorabots is a web site that uses a hidden source program written in a commercial variant of Lisp and implements most of AIML with some variations--they make impressive but unverifiable claims about the size of their user community.

## **1.0 Interest in Research Area**

There are more and more Chinese language e-learners today with more and more different courses and programmes of different depth, difficulties, scopes, focuses etc. available. How to use an interesting, intelligent and user-friendly methods and technologies to match the potential Chinese language e-learners with the most suitable courses and programme is an attractive and challenging research question to me. The AIML based artificial intelligent Robots might be one of the answers.

## **1.1 Research Objectives**

1 – To identify, test, find the causations of the relationships of Chinese language learner's asked questions while they have a free conversation with a virtual robot and their Chinese proficiency level, their psychology, their self-confidence, their interested complementary, supplementary information etc.

2 - To explore the possibility of detecting correctly Chinese learners' Chinese proficiency level, their psychology, their self-confidence, their interested complementary, supplementary information etc. by analysing their asked questions while they talking freely with a virtual robot.

## **1.2 Research Questions**

1. How to identify, test, find the causations of the relationships of Chinese language learner's asked questions while they have a free conversation with a virtual robot and their Chinese proficiency level, their psychology, their self-confidence, their interested complementary, supplementary information etc.?

2. How to explore the possibility of detecting correctly Chinese learners' Chinese proficiency level, their psychology, their self-confidence, their interested

complementary, supplementary information etc. by analysing their asked questions while they talking freely with a virtual robot?

### **1.3 Research Contribution**

It is predicted that the findings of this research will be of particular interest to Ministries of Education, E-Learning researchers, Educational strategists, E-Learning Research Institutes, Education Legislatures and general E-Learners.

### **1.4 Literature Review**

#### **1.4.1 Multi dimensional assessment with different sources of information**

Foxcroft and Roodt (2001) propose multi dimensional process psychological assessment analysis that involves gathering and integrate different sources of relevant information with the intent only one result.

After many years of disappointment and perceived irrelevance, theories of teaching and learning in the secondary and tertiary institutions are beginning to gain widespread consensus amongst psychologists and practitioners. We have some knowledge of how students learn and how to put that knowledge to practical use, but we don't know much about the technology of assessment. Although there are some progresses in the development of assessment tasks that are criterion referenced to crucial stages in the acquisition of academic competence. (Biggs 1994, p. 14)

From the above literature, the researcher knows that learning assessment is still underdeveloped and the multi dimensional process approach could be explored.

#### **1.4.1.1 Easy, lively, comfortable, unbiased and unassisted self report learning assessment**

##### ***Cost saving and time efficient***

Cost savings and speed to productivity are the uniqueness of e-learning, ( Britt 2004, pp. 36-40 ) thousands of organizations have benefited from these by integrating e-learning content and technologies into training processes.

For the purposes of cost saving, using of computers and the Internet, interview alone might not be enough for assessment and testing, because the different condition of interviewees. (Groth-Marnat 1999) Accordingly the researcher's robot type survey and assessment might be a cost saving, time efficient instrument and might integrate learner feedbacks.

##### ***Easy, lively, unbiased self report***

Wiederman (1999) supports easy, lively, comfortable and unbiased assessment environment without biased demonstration that may distort the research results. The researcher's robot type survey and assessment is unmonitored and without biased demonstration for learners.

Anxiety and depression are detrimental to memory, learning efficiency, effectiveness. (Eysenck & Keane, 1995, pp. 435-447)

Elliot (2000) proves that psychological assessment is useful for learners and it should be done unassisted and independently by the learners. The researcher followed Elliot's advice for the learning survey and assessment with no unnecessary assists and interventions.

For the purpose of interpreting the deeper unconscious reality, self report psychological assessment could be used, because learners are willing and motivated to

do self report assessment in their ideal environment, atmosphere, pace, speed, continuity, intermittency, stress level etc. (Osberg 1989) The researcher must be able to interpret the self report properly as well as the important information of the self confidence rating by learners themselves. Also past behavior of learners' attention, intelligence and (private self consciousness) introspectiveness might increase accuracy of self-reporting. Opposite to the above, public self-consciousness might decrease accuracy of self-reporting.

Levy & Plucker (2003)'s report reaffirm that learners' psychological traits, self-report and projective measures are very important for psychological assessment.

The researcher's robot type, self help, unmonitored free conversation learning assessment and survey might gauge learners' deeper unconscious reality; could put learners into the environment, atmosphere, pace, speed, stress level etc. of their own choices; may let learners to pay more attention to their past behavior, private self consciousness; can remove the embarrassment and bad effects of public self-consciousness, because learners' privacy is duly respected, protected and encouraged. The researcher also let learners indicate their self-confidence rating of their own survey and assessment.

### ***Spontaneous recollection of the memory***

Alexander (1988) believes that the spontaneous recollection of the memory learner's has lived and the direct interviews that focus on live experiences are the richest sources to extract most meaningful information of learners' psychology. The freer, less consciously and more indirect the information, the more reliable and more accurate the results are. To achieve this, we have to break the conscious communicational intent of the content. The researcher's robot type learning survey and assessment are relatively free, less consciously and less direct.

Alexander (1988) also points out the key assessment areas that researchers should pay attention to. They are Saliency, frequency, uniqueness, negation, emphasis, underemphasis,

omission, error, distortion, incompleteness and isolation. The researcher will follow this instruction when analyzing the assessment.

### ***Combination of traditional and interactive assessment***

Tang (1994) demonstrates the effects of different modes of assessment on student learning that at one end of the spectrum of research on student learning, theorists such as Riding and Cheema (1991) have emphasized the importance of trait-like and habitual learning styles in determining an approach to learning, however at the other end, straight phenomenography is based entirely on student perceptions of the context (see for example Marton and Säljö, 1976). The results of the present study do not only support the two ends of the spectrum, they also go beyond to indicate an interactive model between the presage personological and contextual influences on learning.

Since effective and useful dynamic and interactive approach to psychological with helpful individualized and tailored interactive assessment can produce otherwise unavailable information, normative and standardized PA have been criticized for not related to motivations and learning process underlies. Learners' unassisted performance or zone of actual development can explore their potentials to some degree that is more important than only their current status. (Haywood & Wingenfeld 1992, pp253-268) Comparisons should be made between traditional and interactive assessment to find their advantages.

The researcher's robot like and conversation focused learning assessment and survey gives learners ample chance for unassisted, developing, dynamic and interactive performances that may produce otherwise unavailable information to find learners' motivations, potentials and learning process underlies. Because the researchers' assessment is a mixture of traditional (part of the first half survey) and interactive assessment, comparisons may be made between them and statistical significance will be examined.

Liou, et al. (2003) believe in evaluation methods such as psychometric means in a comparison design, discourse analysis, conducted portfolio in order to advance the understanding of learners' behavior when they work online. They envision that learners will be capable of the complex problem solving needed to network with foreign language users in other countries. This is a means to achieving the goal of

learner autonomy and life-long learning, so learners can move from computational scaffolding to full participation in the native speaking discourse community.

The researcher's robot type learning survey and assessment can not only open relevant and useful websites for learners to get vital information as well as to communicate with native speakers, but also can provide problem solving experience in virtual realities. Learners' survey and conversational record stored in the online database will be analyzed by using psychometric means.

The researcher is not alone at this front; Loritz (1999) is continuing to focus their efforts on developing GPARS technology as a diagnostic aid to teachers and researchers. GPARS is a generalized transition network system designed for language study by both students and researchers.

“It is important to place these potential interaction effects into a broader context. First, we should remember that the largest percentage of the variance in foreign language learning outcomes will continue to be the main effect based on the overall ability level of the learner and the overall level of difficulty of the language. However, within this general framework, we need to study additional interactions for both practical and theoretical reasons. Second, this model of learner-language interactions ignores the other important determinant of the outcome of language learning, which is the nature of the educational treatment. A good teacher may be able to help a good student overcome some particular roadblock during language learning. At the same time, a good learner may be able to make use of the teacher as a resource in the process of overcoming specific disabilities or difficulties.” (MacWhinney 1994)

The researcher totally agrees with MacWhinney (1994)'s view and approach and will put potential interaction effects into practice by the robot like and conversation-focused learners' survey and assessment.

#### **1.4.1.2 Learning assessment enhancing critical thinking, creativity and spontaneous recollection of memory**

Critical thinking is a very important skill for teaching, learning and psychology. (McCarthy-Tucker 2001) The researcher's robot type learning survey and assessment might spur learners' critical thinking activities.

According to Thompson & Randall (2001, pp. 289-292 ), Creativity, imaginative activity and originality are not unique to the arts, but to all areas of everyday life. Not all people believe that creativity can be taught in e-learning environment and education. Strong self-belief, esteem and positive self-image in their creative and other related abilities are vital and fundamental for highly creative people and e-learners. E-learning is just the tool and environment to create the creative possibility for e-learners to try and to perform to foster their creativity. The researcher's robot like learning survey and assessment could give the desired environment to some extent for creativity.

#### **1.4.1.3 Conversation is very important for learning assessment**

Metros & Hedberg (2002) consent that e-learners need outcomes and interactivities.

Fox & MacKeogh (2003, p. 121)'s evaluation points out that students can engage in higher-order learning by developing effective ways of conducting online discussion without demanding excessive tutor time. The researcher's robot like learning survey and assessment might give learners' more chance to engage in conversation and discussion. This gives learners more control of their learning and more interactivities that are promoted by Britt (2004).

Also Northrup (2002, pp. 219-226) stresses the importance of conversation as well, because timely response from peers and instructors may keep learners motivated and entertained.

However in reality few systems that allow the user to engage in some form of meaningful dialogue. (Seneff, Wang & Zhang 2005) Perhaps the most closely related research is the Fluency project at CMU, where carefully constructed questions are intended to solicit with extremely high likelihood a small number of possible answers. (Eskenazi, 1999) has recognized the benefits of giving the student an active rather than a passive role in the exercise, for the purpose of improving language retention rate, they are currently pursuing, aimed at the ambitious goal of providing spoken conversational interaction with a computer as an aid to second language acquisition.

The researcher's learners' survey and assessment is totally active dialogue focused with the aid of computers and the Internet.

Witt (1999) is confident that speech recognition and assessment is the future trend of Chinese learning assessment. The researcher's active dialogue centered learners' assessment and survey is to some level related to this trend, but at this stage the researcher has neither resources nor time for this task. This could be the researcher's future perspective.

From dialoguing with these individuals with content area expertise and working with those faculty who have the "time, expertise, and facilities", service providers are better able to clarify course expectations, identify creative learning and testing options, and generate new learning alternatives through collaborative input. (Scott & Manglitz 1999) (Ganschow & Sparks 1987) The researcher's learning survey and assessment collaborate with learners to negotiate possible options and alternative for learners.

#### **1.4.1.4 Functional behavior assessment**

Functional behavior assessment is a branch of psychological assessment that is to find the causes effects relations of psychological and behavioral variables. The behaviors should be observable, measurable and can be retested. (Shriver, Anderson & Proctor 2001, Vol. 30, No. 2, pp. 180-192) Functional behavior assessment makes the

researcher's assessment analysis clearer and more profound. Generally speaking the learners' behaviors are observable, measurable and retestable.

Ritzler (1992) thinks that both behavioral and non-behavioral assessment are important and they may complement each other.

#### **1.4.1.5 Dynamic assessment and intervention programs for learning assessment**

Berman (2003) proposes Vygotsky's theories of integrated learning, teaching and assessment and Feuerstein's theory of cognitive modifiability and their derivative of Dynamic assessment' target is to provide conventional measures of learning as well as to explore the nature of that learning and to complement the conventional tool kit of psychometric tests available to school psychologists and to provide another angle and level on learning. It links psychology practice and the teaching and learning closer in the classroom.

Lauchlan & Elliott (2001, p. 647)'s theory and experiment yield half positive results for dynamic assessment or learning potential for learning difficulty children.

**“Background.** The paper considers the construct of learning potential (or dynamic assessment) and its use in the psychoeducational assessment of children with learning difficulties.

**Aims.** The principal research aim was to examine the extent to which learning potential (dynamic) assessment can predict which children with severe learning difficulties will gain most from a structured programme of cognitive intervention.

**Sample.** The sample consisted of 30 children (mean age 9 years) based in a school for children with moderate/severe learning difficulties.

**Methods.** Half of the children were assessed both before and after the delivery of a 15-month cognitive intervention programme undertaken by the first author. The other

half took part in the assessments but continued with their usual classroom programme. Assessments included the use of both dynamic and static measures. On the basis of the assessments, students were divided into high and low potential groups and comparison of gains after the intervention was undertaken.

**Results.** The measurement of learning potential appeared to predict subsequent performance in some, but not all, areas. Those who were most likely to make gains were those children deemed as 'high potential' who also received the cognitive intervention.

**Conclusions.** The value of learning potential assessment was not clearly demonstrated. The implications of the results are explored and, in particular, the authors warn of the dangers of drawing upon the results of learning potential measures in an inappropriate fashion."

The researcher's dynamic learning survey and assessment gives necessary responses and modification after careful quantitative and psychological analysis that may have a chance to test the aforesaid dynamic learning assessment again.

## **1.4.2 The detailed steps to apply the aforementioned theories**

"Conclusively designing a complex assessment is hard work. There are problems of content, functionality, and communication. There are issues of psychology, statistical modeling, and fulfillment of purpose. To make the process efficient, we want to provide the designer with as much structure as we can without constraining design options unnecessarily. We want to maximize opportunities to reuse assessment objects and processes." (Almond, Steinberg & Mislevy 2002)

### **1.4.2.1 Multimedia-rich assessment**

Power (2002) proposes multimedia-rich illustrations to develop website software to evoke learners' verbal/linguistic intelligence in accordance with Gardner's multiple

intelligences theory. The researcher's learning assessment and survey has used website software to evoke learners' verbal & linguistic intelligence according to Gardner' multiple intelligences theory.

Eysenck and Keane (1995, p. 45) point out that visual perception is well organised or grouped together. Similarity, proximity etc are the determining factors for the visual display organisation, so how to organise or produce similar or proximal elements of pictures, animations or learning environment to learners' advantages is a prior consideration. The researcher's learning survey and assessment will consider similarity, proximity grouping for the advantages of learners.

Treisman's experiment confirms that echoic store that is a transient store in the auditory modality consisting of relatively unprocessed auditory input is real. (cited in Eysenck & Keane 1995, p126) This means sound and verbal impression is helpful for learners. The researcher will add sound and verbal components into the learning survey and assessment if time is enough.

Almond, Steinberg & Mislevy (2002) propose a four-task model for e-learning assessment

1. We start with the *Reading Task Model*. In this kind of task, our presentation material is a representation of the character.
2. The *Phonetic Transcription Task Model* requires only a simple change from the Reading Task Model. For this kind of task instead of a speech sample, the expected response would be a short string of characters that give the phonetic pronunciation.
3. In the *Writing Task Model*, the presentation material will consist of one of the pronunciations of the character, followed by an example of its usage in a common word or phrase.
4. For the *Character Identification Task Model*.

The researcher's learning assessment utilized most of these task models.

#### **1.4.2.2 Design tips**

Cassarino (2003) teaches that applicable metaphors, grouping of themes, user determinations, user choices, obvious indication of what is it, how to use it and what do I know as well as different media type choices should be the instructional design principles for e-learning environment. If time allows, the researcher will use proper metaphors, classify different themes, give users different media type options and provide virtual human or animation instructions.

Lotherington (1999) thinks that bilingual environment is possible and helpful for language learning. The researcher has some bilingual content in the learning assessment and survey.

#### **1.4.2.3 Negotiating goals and analyzing interaction for the learning assessment**

Hirumi (2003) confirms that negotiating learning strategy, learning goals and objectives; analyzing learning interaction; evaluating heuristic scenarios are valuable for e-learning. Generally the researcher followed these steps in the robot like learning assessment and survey.

Hirumi ( 2002, p. 141 ) emphasize 6 steps to plan for 3 e-learning levels. The 3 levels are:

1. The interaction within learners' own mind, ego, cognitive movement.
2. The interaction among human-human of learner-instructor, learner-learner, learner-other human and the interaction between human-nonhuman of learner-content, learner-interface, learner-environment.

3. Learner-instruction interaction level consists instruction strategy, research and theory.

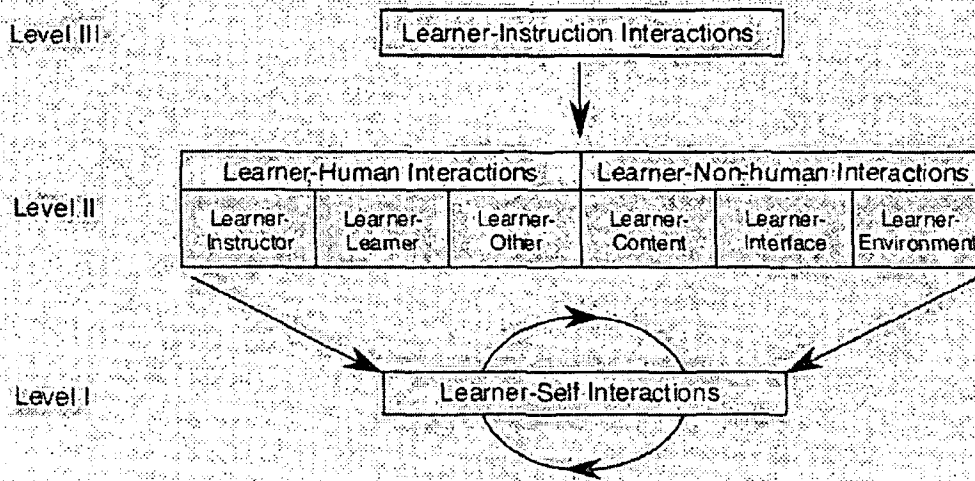

FIGURE 1  
Three Levels of Planned Elearning Interactions

*A Framework For Analyzing, Designing, and Sequencing Planned Elearning Interactions*

- Step 1— Identify essential experiences that are necessary for learners to achieve specified goals and objectives (optional);
- Step 2— Select a grounded instructional strategy (Level III interaction) based on specified objectives, learner characteristics, context and epistemological beliefs;
- Step 3— Operationalize each event, embedding experiences identified in Step 1 and describing how the selected strategy will be applied during instruction;
- Step 4— Define the type of Level II interaction(s) that will be used to facilitate each event and analyze the quantity and quality of planned interactions;
- Step 5— Select the telecommunication tool(s) (e.g., chat, email, bulletin board system) that will be used to facilitate each event based on the nature of the interaction and
- Step 6— Analyze materials to determine frequency and quality of planned eLearning interactions and revise as necessary.

FIGURE 3  
Six Step Process for Designing and Sequencing eLearning Interactions

The researcher's learning assessment and survey give maximal possibility of interaction and communications.

Learning evaluation and feedback are very important part of learning assessment as well as pre learning activities. (Berge 2002) The researcher's learning assessment and survey is all about learning evaluation, feedback and pre learning activities.

#### **1.4.2.4 Software runs directly from the Internet**

Abernathy & Allerton (1999) idealize that a personal file or software can run directly from the Internet and search the Internet like an agent for useful information for clients. The researcher's learning assessment and survey can run directly from the Internet and search the Internet for useful information for the users.

#### **1.4.3 Culture consideration for learning assessment**

Impact of culture and history on psychological assessment is significant. (Deters & Zerbe 2000)

Glass (2001) certifies that cultural consideration for sub test is warranted.

Grados & Russo-Garcia (1999) state that data should be analyzed according to different population and minority groups' unique situation and circumstances. These mostly affect crystal abilities (gain by education and accumulation) rather than fluid abilities (innate problem solving ability without education and culture).

According to this theory, the researcher asks which continent the learner is from in the survey and assessment in order to take cultural differences and influences into consideration.

##### **1.4.3.1 Culture and language learning is inseparable**

“This thesis is concerned with the contribution and incorporation of the teaching of culture into the foreign language classroom. More specifically, some consideration will be given to the *why* and *how* of teaching culture. It will be demonstrated that teaching a foreign language is not tantamount to giving a homily on syntactic structures or learning new vocabulary and expressions, but mainly incorporates, or should incorporate, some cultural elements, which are intertwined with language itself. Furthermore, an attempt will be made to incorporate culture into the classroom

by means of considering some techniques and methods currently used. The main premise of the paper is that effective communication is more than a matter of language proficiency and that, apart from enhancing and enriching communicative competence, cultural competence can also lead to empathy and respect toward different cultures as well as promote objectivity and cultural perspicacity.” (Thanasoulas 2005, p.1)

Thanasoulas (2005) also confirms that foreign language learning is not only about code, rules, sound and grammars, but also about it's conveyed cultures, beliefs, religions, customs, background and history that give real life and meaning to languages. It is about cultural understanding, cultural behaviourism and cultural manipulation as well. Cultures and languages are deeply incorporated and intertwined just like the two sides of the same thing. There are 5 reasons for the tight relationship between culture and language:

1. Language acquisition does not follow a universal sequence, but differs across cultures;
2. The process of becoming a competent member of society is realized through exchanges of language in particular social situations;
3. Every society orchestrates the ways in which children participate in particular situations, and this, in turn, affects the form, the function and the content of children's utterances;
4. Caregivers' primary concern is not with grammatical input, but with the transmission of social cultural knowledge;
5. The native learner, in addition to language, acquires also the paralinguistic patterns and the kinesics of his or her culture.

There are 7 goals and means of language and culture learning:

1. To help students to develop an understanding of the fact that all people exhibit culturally conditioned behaviours.
2. To help students to develop an understanding that social variables such as age, sex, social class, and place of residence influence the ways in which people speak and behave.
3. To help students to become more aware of conventional behaviour in common situations in the target culture.
4. To help students to increase their awareness of the cultural connotations of words and phrases in the target language.
5. To help students to develop the ability to evaluate and refine generalizations about the target culture, in terms of supporting evidence.
6. To help students to develop the necessary skills to locate and organize information about the target culture.
7. To stimulate students' intellectual curiosity about the target culture, and to encourage empathy towards its people.

Cultural problem solving, cultural comparison and cultural complement are some of the effective and stimulating methods for cultural learning. Learners should be aware of speech acts, connotations, etiquette, that is, appropriate or inappropriate behaviour which are the proper starting points for culture learning. (Thanasoulas, 2005)

The researcher's learning survey and assessment use robot like conversation to analyze learners' cultural background and cultural awareness to do necessary adjustment and modification and provides settings for cultural problem solving, cultural comparison and cultural complement (such as some bilingual and cultural explanations).

### **1.4.3.2 Online learning is not suitable for all cultural backgrounds**

Online learning is not suitable for all cultural backgrounds, social classes, religious sectors and geographical locations. (Kearsley 2002) For example, online learning might not be suitable for American aborigines, special disabled persons and some non-western countries, so we have to consider these before we can effectively apply online learning to a suitable target audience.

### **1.4.3.3 Telecommunications and exchanges cultivate culture awareness**

O'Dowd (2004) found that telecollaborative exchanges were able to facilitate culture learning for learners by providing different versions of knowledge which are totally different from the ordinary textbooks and other traditional Cultural Studies resources. They are not completely objective; rather they depend on the learner's own subjective and personalised accounts and nature for the real world.

Applying different online tools and media could enhance Telecollaborative exchanges' functionality and efficiency. O'Dowd (2004) also revealed that the three key elements of successful intercultural telecollaboration are the definition of culture, skills of interaction and analysis that are not innate talents or capabilities which need cultivation.

The first step is to develop an anthropological definition and the real meaning of a culture and its cultural behaviour rather than the behaviour itself. Secondly learners should master the necessary skills, knowledge and techniques for interactive, responsive, productive, insightful, investigative and enquiring online expressing their own culture and learning their counterparts' cultural heritage. Finally learners need to develop their own analytical and perceptive capability to really understand the online cultural contents. (O'Dowd 2004)

The researcher's learning survey and assessment used Internet based robot like conversation as the tool and platform for telecollaborative exchanges in order to

cultivate learners' culture awareness, define culture meanings, facilitate culture interactivities and understanding.

“In conclusion, the findings of this study have found that individuals respond in a manner, perhaps even a mind-set, that is consistent with the culture of the language in which they are responding. While these findings support the theory presented, one study does not prove a theory. Therefore, further research to evaluate this phenomenon is needed. However, these findings strongly suggest the conclusion that researchers who do not use native language instruments may be losing valuable cross-cultural information.” (Ralston, Cunniff & Gustafson 1993) So the researcher's learning survey and assessment attempted some bilingual elements.

Courcy (1997) promotes culture awareness especially for immersion stage.

## ***1.5 Theory and Hypotheses***

### **1.5.1 The General Three Difficulty Levels of Chinese Language Learning**

1. The very beginners with no or very little knowledge of Chinese language.
2. Learners have some intermediate knowledge of Chinese language.
3. Learners have advanced knowledge of Chinese language.

### **1.5.2 Questions the Learners at the Three Different Difficulty Levels of Chinese Language Learning Most Likely will Ask**

- 1.1 How long does it take me to be an intermediate Chinese speaker?
- 1.2 Is it possible for me to learn Chinese?
- 1.3 Is it useful to learn Chinese?

- 1.4 Please tell me the earning potential of learning Chinese.
- 1.5 Is it difficult to learn Chinese?
- 1.6 Is it easy to find a Chinese related job?
- 1.7 Please tell me the meaning, pronunciation of a special Chinese character, characters or phrases.
- 1.8 Please explain a special Chinese character, characters, phrases or sentences for me.
- 1.9 What is the meaning or pronunciation of a special Chinese character, characters, phrases or sentences?
  
- 2.1 What is the synonym of a special Chinese character, characters.
- 2.2 What is the antonym of a special Chinese character, characters.
- 2.3 What is the meaning, pronunciation or origin of Chinese idioms, proverbs, set phrases or short paragraphs?
- 2.4 Please explain the Chinese idioms, proverbs, set phrases and short paragraphs for me.
- 2.5 May I speak with native speakers?
- 2.6 How to write Chinese sentences.
- 2.7 How may I have my self-written Chinese sentences corrected?
- 2.8 Please explain the simple short novels and fictions; simple poems; grammar; simple classical Chinese and ancient prose for me.
- 2.9 What is the meaning, origin of the simple short novels and fictions; simple poems; grammar; simple classical Chinese and ancient prose.
- 2.10 Please recommend suitable simple short novels and fictions; simple poems; simple classical Chinese and ancient prose for me.
- 2.11 What simple short novels and fictions; simple poems; grammar; simple classical Chinese and ancient prose do you like?
- 2.12 May I befriend and communicate with native speakers and fellow learners?
- 2.13 How to write Chinese short paragraphs.
- 2.14 How may I have my self-written Chinese paragraphs corrected?
  
- 3.1 Please explain long novels, ancient poems, literature history, original complex form of Chinese characters, ancient characters and Chinese calligraphy for me.

3.2 What is the meaning, origin of long novels, ancient poems, literature history, the original complex form of Chinese characters, ancient characters and Chinese calligraphy.

3.3 Please recommend suitable long novels, ancient poems, literature history, original complex form of Chinese characters, ancient characters and Chinese calligraphy for me.

3.4 How to find a Chinese related job?

3.5 Do you like what long novels, ancient poems, literature history, original complex form of Chinese characters, ancient characters and Chinese calligraphy?

3.6 How to create and write Chinese short novels and fictions; simple poems; simple classical Chinese and ancient prose?

3.7 How may I have my works published or corrected?

3.8 How may I contact Chinese language experts?

3.9 What classical literature history, great classical literature works, Chinese dialects etc. do you like?

3.10 Please give your opinions of classical literature history, great classical literature works, Chinese dialects etc.

3.11 Please recommend classical literature history, great classical literature works, Chinese dialects etc. for me.

3.12 How to form and join various Chinese literature society and association.

3.13 How to write novels, prose, poems etc.

3.14 How to have my novels, prose, and poems published.

3.15 How to contact famous writers and scholars.

3.16 How may I find a better Chinese language related job?

### **1.5.3 Horizontally related courses and programmes**

Japanese, Korean, Thai, Vietnamese etc. language learning.

### **1.5.4 Vertically related courses and programmes**

Chinese music, songs, arts, sculptures, dancing, sports, politics, economy, history, architecture, media, culture, military, legal system etc.

### **1.5.5 Complementary courses, programmes or products**

Free Chinese learning software, Chinese learning resources directory, self-learning materials and software, work and language learning programme, Chinese Universities' information, traditional Chinese learning directory.

### **1.5.6 Supplementary courses, programmes or products**

Chinese pronunciation fast courses, Chinese costumes, Chinese pens, Chinese papers, Chinese musical instruments, Chinese custom introductory courses, Chinese dictionaries, Chinese maps, Chinese travel information, Chinese airlines etc.

## **2. Methodology**

### **2.1 Quantitative, Qualitative and Case Studies**

#### **2.1.1 Four Different Views of the Nature of Mathematics**

There are four different views with respect to the nature of mathematics and its role in sciences. The functionalist paradigm views mathematics as discoveries about a special realm of objects that exist prior to our knowledge of them. The interpretive paradigm views mathematics as a social invention and mathematical proofs as only one part of a larger social process whereby mathematicians come to feel confident about a theorem. The radical humanist paradigm views mathematics as constituting the core of science and that the rationality of science and technology is immanently one of control: the rationality of domination over nature and man. The radical structuralist paradigm

views mathematics as being historically specific and class determined, that is, to satisfy the requirements of a social class in an historical period. (Ardalan 2005)

The researcher's methods are the mixture of the above four views, but more weights have been located to the first three paradigms.

Viewing the learning assessment from different subject, area, time, space, angles and perspective might give researchers fresh thinking about the same subject by temporarily relaxing taking-for-granted assumptions and point of views.

### **2.1.2 Quantitative, Qualitative, Classical 'Positivistic' Design and Case Studies**

A research methodology will be decided upon which at this point in time is likely to be a hybrid of quantitative, qualitative, case study and classical 'positivistic' design with which data will be gathered by reliable sources and as objective as possible means. Walliman (2001)'s and Stake (1995)'s book will be used. The gathered information will be quantified and analysed. Its trends, pattern and peculiarity will be explored. Reliability will be tested. The data will be collected using all the safeguards exercised by researchers with respect to reliability, validity and sensitivity of the questions.

Explanatory cases are proper for doing causal studies. In very complicated and multivariate cases, the analysis can make use of pattern-matching methods. (Yin and Moore 1988) It is suitable for the researcher's study.

Yin (1994, p. 20) identified five components of research design that are important for case studies:

1. A study's questions
2. Its hypotheses
3. Its unit(s) of analysis
4. The logic linking the data to the hypotheses

## 5. The categories for explain the findings

The researcher used this procedure for my research.

(Yin, 1989) recommended the selection that offers the opportunity to maximize what can be learned if knowing that time is not enough. Hence the cases that are selected should be easy and willing subjects. A good instrumental case does not have to defend its typicality.

Analytic methods of rearranging the arrays, placing the evidence in a matrix of categories, creating flowcharts or data displays, tabulating the frequency of different events, using means, variances and cross tabulations to examine the relationships between variables etc are suitable for case studies. (Miles & Huberman 1984)

### **2.1.3 Detailed Quantitative Analysis**

#### **2.1.3.1 the Chinese language learning survey and assessment collected data**

Below is the screenshots of my Microsoft Access database:

**2.1.3.2 Use Bayes simplified formula to calculate the possibility of level 1, level 2 and level 3 of Chinese language proficiency when the level 1, level 2 and level 3 questions appear.**

Set L1 = level 1 proficiency; L2 = level 2 proficiency; L3 = level 3 proficiency; Q1 = level 1 questions; Q2 = level 2 questions; Q3 = level 3 questions;

$$P(L1|Q1) = \frac{(P(Q1|L1)*P(L1))}{((P(Q1|L1)*P(L1))+ (P(Q1|L2)*P(L2)+(P(Q1|L3)*P(L3)))}$$

There are total 76 questions asked by level 1 users (according to the survey checkboxes they ticked). Of these, 9 questions are not level 1 questions, so  $P(Q1|L1) = 67/76 = 0.8816$ .  $P(L1) = 1/3$ . There are total 14 questions asked by level 2 users. Of these, 3 questions are level 1 questions.  $P(Q1|L2) = 3/14$ . There are total 61 questions asked by level 3 users. Of these, 5 questions are level 1 questions.  $P(Q1|L3) = 5/61$ .

$$P(L1|Q1) = (67/76 * 1/3) / (67/76 * 0.333 + 3/14 * 0.333 + 5/61 * 0.333) = (0.8816 * 0.333) / (0.8816/3 + 0.2143/3 + 0.082/3) = 0.29387/0.3926 = 0.749$$

$$P(L2|Q2) = \frac{(P(Q2|L2)*P(L2))}{((P(Q2|L1)*P(L1))+ (P(Q2|L2)*P(L2)+(P(Q2|L3)*P(L3)))}$$

$$= (10/14 * 1/3) / (9/76 * 0.333 + 10/14 * 0.333 + 30/61 * 0.333) = (0.714 * 0.333) / (0.118/3 + 0.714/3 + 0.49/3) = 0.238/0.44 = 0.54$$

$$P(L3|Q3) = \frac{(P(Q3|L3)*P(L3))}{((P(Q3|L1)*P(L1))+ (P(Q3|L2)*P(L2)+(P(Q3|L3)*P(L3)))}$$

$$= (26/61 * 1/3) / (0 + 1/14*0.333 + 26/61*0.333) = (0.426 * 0.333) / (0 + 0.0714/3 + 0.426/3) = 0.146/0.1658 = 0.88$$

So conclusively  $P(L1| Q1) = 0.749$ ;  $P(L2| Q2) = 0.54$ ;  $P(L3| Q3) = 0.88$ . When a user asked level 1 questions or mostly level 1 question, we may estimate the possibility that the user is a level 1 user according to my Chinese language learning survey and assessment sample. We may also estimate the possibilities that the user is a level 2 or level 3 learner if the user asked some but not most level 2 or level 3 questions. For example, an user asked 2 level 1 questions and 1 level 2 question, then we may use the  $P(L1| Q1) = 0.749$ ;  $P(L2| Q2) = 0.54$

According to the sample.

$$P(L1|userX) = 2/3 * 0.749 = 0.5$$

$$P(L2|userX) = 1/3 * 0.54 = 0.18.$$

### **2.1.3.3 Calculate the statistics of the data collected**

Below is the occurrence data that has removed the irrelevant data of “0” that might interfere the correct interpretation and analysis of the data.

2	2	2	2	1	2	3	3	3	3	3	2	2	1	2	2	2	3	2	2	3	3	3	2	2	2	3	2	3	2	2	2	3

STATUS: NEW FILE No Variables: 30 No Cases: 30

The above is the transposed and rotated OS4 database. Now the cases are the ordinal number questions all the users asked at some point of time and the variables are the according every users, so in this way the researcher can interpret and analyze every user's data against their asked questions.

Mean = 1.333 Variance = 0.333 Std.Dev. = 0.577  
Std.Error of Mean = 0.333  
Range = 1.000 Minimum = 1.000 Maximum = 2.000  
Skewness = 0.000 Std. Error of Skew = 0.000  
Kurtosis = 0.000 Std. Error Kurtosis = 0.000

The sum of all the data is 254. The mean of all the raw data is 1.68. The standard deviation of the sample is 0.749. The standard error of the sample is  $0.749 / \sqrt{151}$  that is .061. The skewness is 0.6 that is positively skewed with less large numbers of 3 (27) than the small numbers of 1 (75), so the mean could potentially be smaller if a more normal and larger sample or population is used. But the skewness still doesn't not exceed the 1 benchmark, therefore is not very significant. The Kurtosis is  $-1$  that is not a big problem.

### 3. Implementation Review

#### 3.1 The General Structure of My Project Website and Program

Pandorabots is the place where the researcher can create and unleash virtual personalities. Pandorabots is an experimental software robot hosting service based on the work of Dr. Richard Wallace and the A.L.I.C.E./AIML free software community. From any browser, the researcher may create, design and publish software robots – and make them available to anyone via the Internet.

The researcher produced 3 AIML files (aim1.aiml, aim2.aiml & aim3.aiml) with javacript code to be uploaded to the pandorabots website to be used together with the

original default AIML files, because the researcher wants the users to talk with the researcher's robot not only about Chinese learning, but also any other topics that the original AIML files can handle.

The researcher used more javascript code than aiml code, because the aiml language lacks the capability of the javascript language to handle complex logical operation and pattern matching. The javascript is much more efficient, full functional than the aiml language at many instances. But the communication and connection among the aiml code, the javascript code and the Microsoft msagent character Merlin are not very easy, since not many examples or experiments over there due to their relatively unexplored status, however finally the researcher solved all the technical problems.

The researcher also produced a HTML file with javascript code and the object of Microsoft msagent (to produce the animation character of Merlin) to be uploaded to the pandorabots website to be used as my Chinese language learning survey and assessment's web page interface.

Users may tick the relevant checkboxes of my survey and assessment, then talk to my robot for their wanted information and answers. All the information of their conversation record and the survey data will be stored in the pandorabots website. The researcher could transfer all the assessment and survey data into a database such as Microsoft Access or Excel. Finally all the data will be analyzed and the whole project can be improved.

### ***3.2 The details of the AIML file with Javascript code***

The researcher produced 3 AIML files in order to let the robot recognise the key words of the conversation of "Chinese", "chinese", "China" and "china" as well as the 3 possible sentence patterns of "xxxx Chinese", "Chinese xxxx" and "xxxx Chinese xxxx", so 3 possible sentence patterns multiple 4 possible key words, the result is 12 different combinations. Therefore the researcher has to produce 12 conversation categories and patterns in the AIML file.

To make the code efficient, the researcher used the tag of <srai> in the file to just refer different questions into a same answer if applicable, but the pandorabots AIML interpreter only allows 3 recursions (use <srai> 3 times) in a single AIML file, the researcher has to split the file into 3 separate AIML files. The main file of aiml1.aiml is provided below. To make things clear, the style of the words of explanation is bold and the most important parts of the code is in boxes. Each explanation is supplied with the resulting screenshot:

```
< ?xml version="1.0" encoding="UTF-8"? >
< aiml version="1.0" >
< category >
    < pattern > cb * </pattern>
    <template>!!! Your Data for my research has been stored. Thank
you!!! Please continue talking with my robot!!!
</template>
</category>
```

The researcher used the pattern of “cb \*”, because we nearly never use this pattern for normal conversation, when this pattern coming in from the html interface webpage, the robot knows they are not normal conversations but learners’ assessment and survey data. Therefore the robot can response properly

by saying: "Your Data for my research has been stored. Thank you!!! Please continue talking with my robot".

### Online Chinese Language Learning Assessment

Please set your pop up blockers as off. Please choose your level of Chinese proficiency first, then choose the information below you want to know as many as possible by clicking the checkboxes. Then you can talk with the robot panda. After submitting, please wait for a while for a new page. If you want to talk with panda about learning Chinese, please include the word 'Chinese' or 'chinese' or 'china' or 'China' in every question. If not, you may still have a free talk with panda without the topic of Learning Chinese. Thanks

<p><b>Your level of Chinese proficiency</b></p> <p><input type="checkbox"/> I don't have any knowledge of Chinese</p> <p><input type="checkbox"/> I am an intermediate Chinese learner</p> <p><input type="checkbox"/> I am an advanced Chinese learner</p>	<p><b>Other Chinese learning related information you might be interested</b></p> <p><input type="checkbox"/> Learning Japanese, Korean, Thai, Vietnamese or other Asian languages</p> <p><input type="checkbox"/> Chinese music, songs, arts, sculptures, dancing</p> <p><input type="checkbox"/> Chinese sports</p> <p><input type="checkbox"/> Chinese politics, military, legal system</p> <p><input type="checkbox"/> Chinese economy</p> <p><input type="checkbox"/> Chinese history</p> <p><input type="checkbox"/> Chinese architecture</p> <p><input type="checkbox"/> Chinese medias, news</p> <p><input type="checkbox"/> Chinese culture</p> <p><input type="checkbox"/> Chinese learning software, Chinese learning resources directory, self-learning materials and software</p> <p><input type="checkbox"/> work and language learning programme</p> <p><input type="checkbox"/> Chinese Universities', colleges' schools' and education information</p> <p><input type="checkbox"/> Traditional Chinese learning method directory</p> <p><input type="checkbox"/> Chinese pronunciation fast courses</p> <p><input type="checkbox"/> Chinese traditional costumes and dresses</p> <p><input type="checkbox"/> Chinese pens, Chinese papers, Chinese ink</p> <p><input type="checkbox"/> Chinese musical instruments</p> <p><input type="checkbox"/> Chinese custom introductory courses</p> <p><input type="checkbox"/> Chinese dictionaries, Chinese maps</p>

}

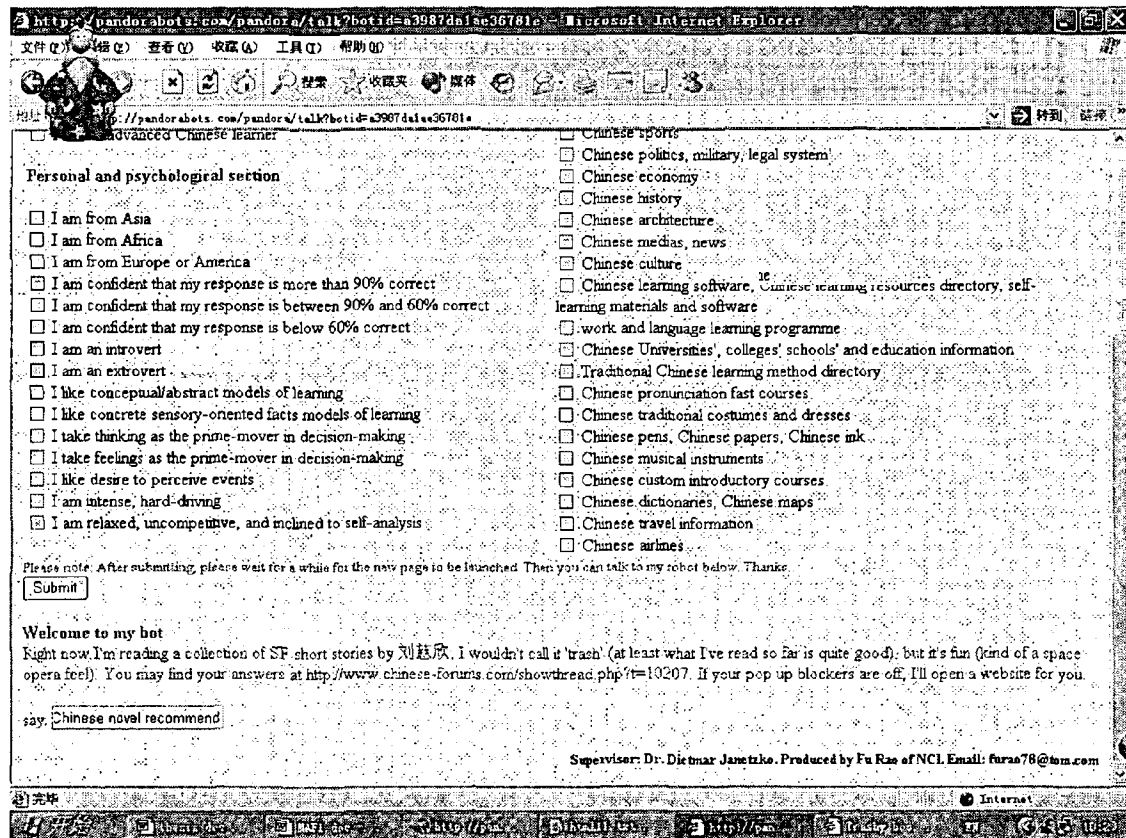

```

The pattern of “Chinese \_” is to catch the pattern of “Chinese xxxx” in a conversation in the AIML language. var y= "<input index="1"/>" is very important to communicate between AIML and Javascript. <input index="1"/> is the AIML user current input content tag. The value of user input will be transferred from AIML to Javascript variable y. To be more efficient, the value of y is forced to be lowercase and transferred to variable x, so now the researcher saved a lot of coding. No matter users used capital letters or not, the lowercased input needs only lowercased pattern only, therefore no coding for capital letters anymore.

Because the AIML interpreter can't parse correctly the Javascript logical operator of “&&”(and), I have to use the method of negative's negative to produce the same effects. The (!(x.match("recommend") || !x.match("novel"))

gives the same effects of `x.match("recommend") && x.match("novel")`. The input sentence pattern matching should be the most specific and detailed the first and more general and simple the next, since if the more general and simple pattern's code used before the more specific and detailed code, then the later code will never be reached and all be wasted.

`window.open('http://www.chinese-forums.com/showthread.php?t=10207')` code opens relevant websites for users, so they may find their answers and more information there. Due to this project's time limitation, most answers to user questions will direct user to the most relevant web pages and users may find their answers and information there. If time allows in the future, the researcher may give more exact answers to the users as well as providing all relevant web pages, also more pattern matching, more precise and detailed pattern matching and more answers could be supplied if time warrants.

Chinese Windows. They work perfectly fine. If you just want to type Chinese you

```

only have to install the East Asian Language support for your windows (you have your windows CDs with you don't you?) ... and if some texts still appear to be complete rubbish you need to set your encoding for non-unicode texts to Simplified Chinese (Mainland China) or Traditional Chinese (Hong Kong, Taiwan ...). Both of these can be done in the Language and International Support in Control Panel. Your copy of Windows will then behave as if it were a Chinese version in almost all occasions, though the user interface is still in English (which might be a plus for you.) The most popular firewall product in China is probably the Norton Suite (called something like '网网网网网' in the mainland) and you can buy it (Chinese version of course) in almost any shops selling non-pirated copies of software. **Some answers don't need opening relevant web pages, because they are straightforward and simple. Below is an example to answer user question of "How long to study Chinese?".**

http://pandorab... id=a3987d61ac36781c - Microsoft Internet Explorer

文件(F) 编辑(E) 查看(V) 收藏夹(I) 工具(T) 帮助(H) 地址: http://pandorabots.com/pandorab/talk?botid=a3987d61ac36781c

It takes about 2 to 4 years to be an intermediate Chinese speaker.

### Online Chinese Language Learning Assessment

Please set your pop-up blockers as off. Please choose your level of Chinese proficiency first, then choose the information below you want to know as many as possible by clicking the checkboxes. Then you can talk with the robot panda. After submitting, please wait for a while for a new page. If you want to talk with panda about learning Chinese, please include the word "Chinese" or "chinese" or "china" or "China" in every question. If not, you may still have a free talk with panda without the topic of Learning Chinese. Thanks.

```

**All the questions about Chinese language learning that the robot at the moment can't provide more accurate and precise answers will be answered in this way and will be directed to the 2 most comprehensive and useful (the researcher's attitude) websites of Chinese language learning and general knowledge of China and Chinese. At these 2 website the users very likely can obtain some related information and knowledge of their interests.**

```
<category>
<pattern> _ Chinese _ </pattern>
<template><srai> Chinese _ </srai></template>
</category>
```

```
<category>
<pattern> _ Chinese </pattern>
<template><srai> Chinese _ </srai></template>
</category>
```

```
<category>
<pattern> _ chinese _ </pattern>
<template><srai> Chinese _ </srai></template>
</category>
</aiml>
```

The above code let the patterns of “\_ Chinese \_”, “\_ Chinese” and “\_ chinese \_” to use the same code as “Chinese \_”, so the researcher may greatly shorten and length of the code and scripting and enhance the efficiency of coding, but because the AIML interpreter at the pandorabots website only allow maximum 3 recursions in 1 single aiml file, so the researcher has to split the total needed possible patterns of “Chinese \_”, “\_ Chinese \_”, “\_ Chinese”, “chinese \_”, “\_ chinese \_”, “\_ chinese”, “China \_”, “\_ China \_”, “\_ China”, “china \_”, “\_ china \_” and “\_ china” into 3 aiml files.

The researcher used the above patterns for the purposes of adding the researcher’s own Chinese language learning aiml files to the original aiml files already installed in the robot, so if the user don’t want to talk about Chinese language learning, they may still have a free chat with the robot about anything they like just for fun by using the pandorabots default engine, at the same time the researcher may get important information such as users’ personality etc. Therefore this is a win-win game and situation.

### ***3.3 The details of the HTML file with Javascript code and Microsoft Msagent animation character implememtation***

```

<html>
<body onLoad="document.form.input.focus();">
<p align="center">
  <script Language="JavaScript">

function checkbox_checker()
{

var content = "";

for (counter = 0; counter < checkbox_form.cb.length; counter++)
{

if (checkbox_form.cb[counter].checked)
{
content = checkbox_form.cb[counter].value + content
}
}
}
document.getElementById("input").value= content;

document.form.submit();

alert("After clicking, please wait for a while for the new page to be launched.
Thanks.")
return (false);
}
</script>

```

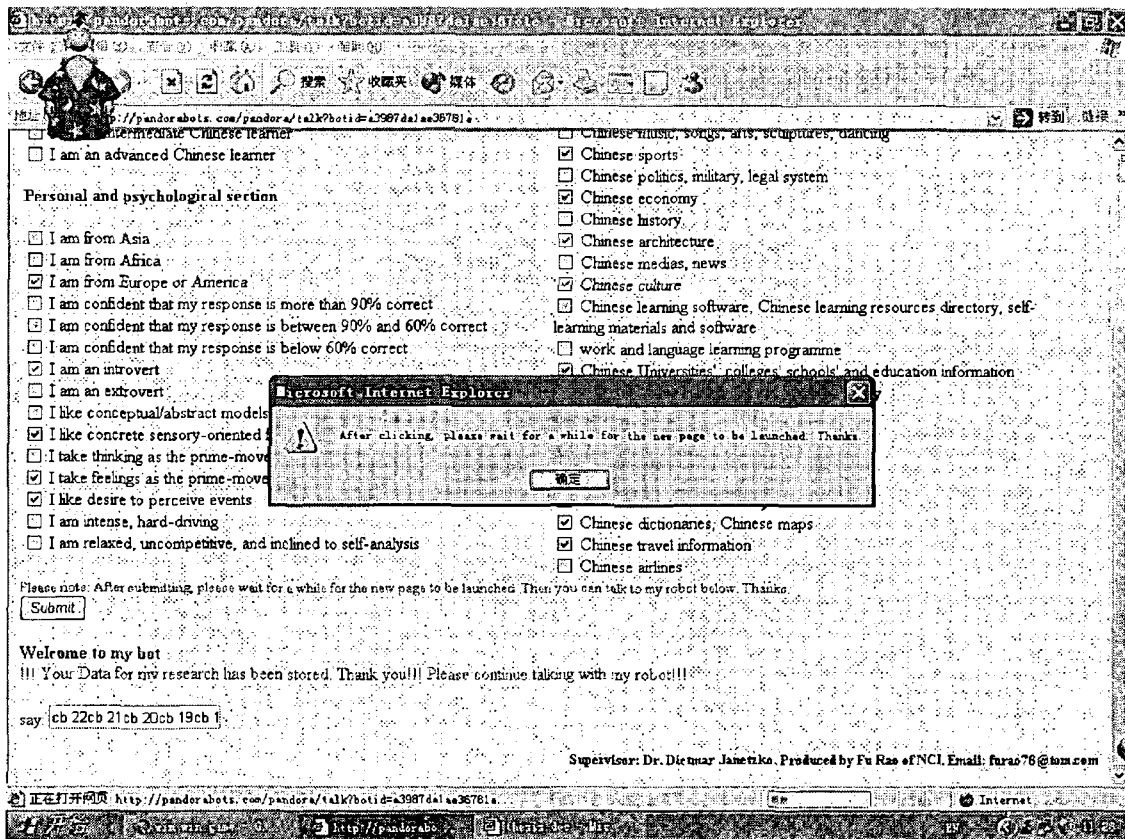

First the `<body onLoad="document.form.input.focus();">` is to put a cursor inside the user input box when the web page is first loaded, so make things easier for users, then the function `checkbox_checker()` will check which checkboxes of the survey is checked by the code of `for (counter = 0; counter < checkbox_form.cb.length; counter++) { if (checkbox_form.cb[counter].checked).` If so it will get the values of the checkboxes in order to identify which boxes are ticked. It also combines all the checked boxes' values into one single string by the code of `content = checkbox_form.cb[counter].value + content.`

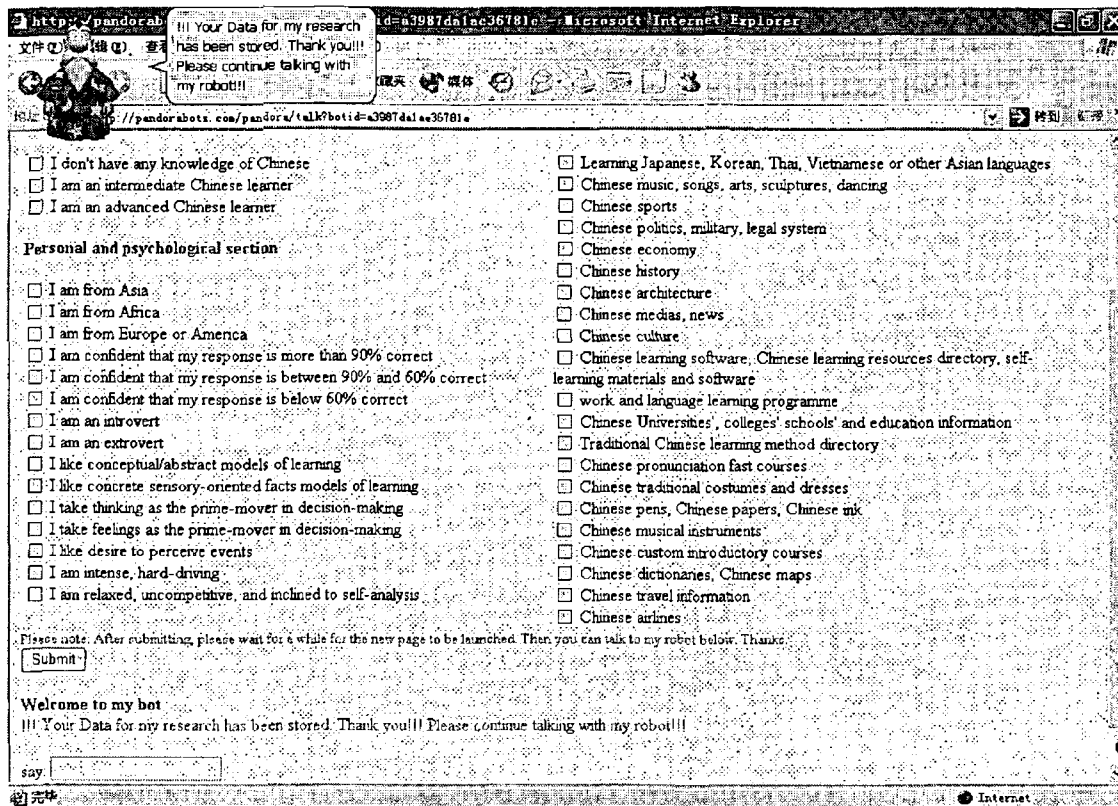

It will automatically put the combined checked boxes' values' string content into the user input box as if it is a normal conversation by the code of `document.getElementById("input").value= content,` then it will automatically

submit the string content to the pandorabots hosting website to be processed as normal dialogue by the code of document.form.submit().

The researcher gives the checkboxes' names as cb[ ], because it is rarely used in a normal conversation, as a result it won't interrupt the dialogue coding. I used the alert coding alert("After clicking, please wait for a while for the new page to be launched. Thanks.") for the sake of auto submitting the survey data into the pandorabots database as if they are normal dialogue contents. Because pandorabots hosting website doesn't allow auto submitting conversations, the researcher has to use the alert box to slow the process of auto submitting. Consequently the pandorabots website can't detect it is an auto submitting and treats it as a human input, so it can be auto submitted successfully.

**Online Chinese Language Learning Assessment**

Please set your pop up blockers as off. Please choose your level of Chinese proficiency first, then choose the information below you want to know as many as possible by clicking the checkboxes. Then you can talk with the robot panda. After submitting, please wait for a while for a new page. If you want to talk with panda about learning Chinese, please include the word "**Chinese**" or "**chinese**" or "**china**" or "**China**" in every question. If not, you may still have a free talk with panda without the topic of Learning Chinese. Thanks.

</font>

</p>

This is to tell users to set their pop up blockers as off, so the robot may open relevant web pages for users. Also it tells users that there will be a delay in the auto data submitting procedure. If users want to talk with panda about learning Chinese, they should include the word “Chinese”, “chinese”, “china” or “China” in their questions. This is for the reasons that according to the researcher’s observation many users used “chinese”, or “china” without the capital letters. By this method they may have a free talk with the robot using the original pandorabots interpretation engine if they don't include the word of Chinese or China in their sentences.

**Your level of Chinese proficiency**

- I don't have any knowledge of Chinese
- I am an intermediate Chinese learner
- I am an advanced Chinese learner

**Personal and psychological section**

- I am from Asia
- I am from Africa
- I am from Europe or America
- I am confident that my response is more than 90% correct
- I am confident that my response is between 90% and 60% correct
- I am confident that my response is below 60% correct
- I am an introvert
- I am an extrovert
- I like conceptual/abstract models of learning
- I like concrete sensory-oriented facts models of learning
- I take thinking as the prime-mover in decision-making
- I take feelings as the prime-mover in decision-making
- I like desire to perceive events
- I am intense hard-driving

**Other Chinese learning related information you might be interested**

var MerlinTopY, MerlinCenterY, MerlinBottomY;
UsedChars = "Merlin";
MerlinID = "Merlin";
MerlinACS = "Merlin.acs";
MerlinURL = "http://agent.microsoft.com/agent2/chars/Merlin/Merlin.acf";
MerlinStates = "Showing, Hiding, Speaking, Moving, Gesturing";
MerlinAnimations = "Greet, Acknowledge, Alert, Blink, Announce, DoMagic1,
DoMagic2, Explain, Wave";
MerlinLoaded = false;
```

**This is to give the Microsoft msagent character Merlin's object id and all the necessary variables, the remote direct Microsoft web link if the robot can't find necessary Merlin acs files in users' local computers as well as Merlin's states and animation movement data. The hotlink to get Microsoft msagent character file of Merlin is MerlinURL = <http://agent.microsoft.com/agent2/chars/Merlin/Merlin.acf>.**

```
Window_OnLoad();

function Window_OnLoad() {
    AgentControl.Connected = true;
    MerlinLoaded = LoadLocalAgent(MerlinID, MerlinACS);
    if (!MerlinLoaded) {
        MerlinLoaded = LoadLocalAgent(MerlinID, ""); }
    if (MerlinLoaded) {
        SetCharObj(); }
    CheckLoadStatus();}

function LoadLocalAgent(CharID, CharACS) {
    AgentControl.RaiseRequestErrors = false;
    if (CharACS == "") {
        LoadReq = AgentControl.Characters.Load(CharID); }
    else {
        LoadReq = AgentControl.Characters.Load(CharID, CharACS); }
    AgentControl.RaiseRequestErrors = true;
    if (LoadReq.Status != 1) {
        return(true); }
    return(false);}

function SetCharObj() {
    Merlin = AgentControl.Characters.Character(MerlinID);
    Merlin.LanguageID = 0x409;}

function CheckLoadStatus() {
    if (!MerlinLoaded) {
        window.status = "Loading " + MerlinID + " Character. Please Wait...";
        MerlinReq = AgentControl.Characters.Load(MerlinID, MerlinURL);
        return(false); }
    window.status = "";
    AgentIntro();
    return(true);}

function LoadError() {
    var strMsg;
    window.status = "";
    strMsg = "Error Loading Character: " + MerlinID + "\n";
    strMsg = strMsg + "This Microsoft Agent Script requires the character(s):\n";
    strMsg = strMsg + UsedChars;
    alert(strMsg);}
```

When the window is loaded (Window\_OnLoad()), the function of function Window\_OnLoad() will run in order to load the msagent Merlin to users' windows if the msagent id and acs file are found and ready to use by the code of MerlinLoaded = LoadLocalAgent(MerlinID, MerlinACS), if the msagent id and acs file are not ready, it will call the load local agent function by the code of if (!MerlinLoaded) ( MerlinLoaded = LoadLocalAgent(MerlinID, "") to find the Microsoft msagent character Merlin's acs file on users' computers by the code of AgentControl.RaiseRequestErrors = false; if (CharACS == "") { LoadReq = AgentControl.Characters.Load(CharID); } else { LoadReq = AgentControl.Characters.Load(CharID, CharACS); } AgentControl.RaiseRequestErrors = true; if (LoadReq.Status != 1) { return(true); } return(false);).

If it can't find the Merlin acs file on users' computers, it will hotlink the Microsoft msagent website and download the necessary file from there by the code of MerlinReq = AgentControl.Characters.Load(MerlinID, MerlinURL) while at the same time it will tell users that it is loading the Merlin files and let them be patient by the code of if (!MerlinLoaded) { window.status = "Loading " + MerlinID + " Character. Please Wait...".

If for whatever reasons no msagent Merlin's acs file can not be found from the local computer and the remote Microsoft msagent support website, it will be detected and the situation will be told to the users by the code of strMsg = "Error Loading Character: " + MerlinID + "\n"; strMsg = strMsg + "This Microsoft Agent Script requires the character(s):\n"; strMsg = strMsg + UsedChars; alert(strMsg);}.

```

function GetScreenPositions() {
  var ScreenWidth = window.screen.width;
  var ScreenHeight = window.screen.height;
  if ((ScreenWidth == 0) || (ScreenHeight == 0)) {
    ScreenWidth = 800;
    ScreenHeight = 600; }
  MerlinCenterX = (parseInt(ScreenWidth / 2) - parseInt(Merlin.Width / 2));
  MerlinRightX = (ScreenWidth - Merlin.Width);
  MerlinCenterY = (parseInt(ScreenHeight / 2) - parseInt(Merlin.Height / 2));
  MerlinBottomY = (ScreenHeight - Merlin.Height);}

function AgentIntro() {
  Merlin.Show();
  Merlin.Speak(document.getElementById('myAnchor').innerText);
}

</SCRIPT>

```

**This is to position the msagent character Merlin at the initial top left corner of users' screens. Merlin will appear by the code of Merlin.Show() and will speak answers to users' questions by the code of Merlin.Speak(document.getElementById('myAnchor').innerText). This is the key code of this project and it will communicate correctly between the animation character msagent Merlin and the AI robot engine from the pandorabots website as well as between the AIML file and language with javascript code attached and the HTML file and language with javascript code attached.**

**If use the standard coding of Merlin.Speak(!OUTPUT) without the above code, the msagent character Merlin won't function and speak properly. It will speak all the javascript code instead of the correct output. The researcher believes what is happening is that the pandorabots website AIML interpreter is sending the actual javascript back because it believes it is being sent to a browser to be interpreted, however in this case it is being sent to the msagent character Merlin which just speaks the information.**

**For the purpose of solving this problem, the researcher has to find a way to let the msagent character Merlin to get his speech content from the web page screen directly rather than from the pandorabots website interpreter engine, so first of all has to create an anchor point "myAnchor" by the code of <a**

`id="myAnchor"> !OUTPUT! </a>`, next to get the output content directly from the web page screen by the code of `document.getElementById('myAnchor').innerText`. The anchor tag's property of `innerText` has to be used, since this is the only feasible code to get Merlin's speech content directly from the web page rather than the pandorabots website engine.

Currently the researcher only tested the msagent Merlin on Internet Explorer and Opera browser. It works fine on the Internet Explorer, but it won't work on the Opera browser, so for the moment run the web page only on the Internet Explorer please.

```

Sum	26.17433
Standard Deviation	0.288579

The standard error = standard deviation / square root of the sample size = .28858 / 5.48 = 0.053

DISTRIBUTION PARAMETER ESTIMATES

VAR1 (N = 30) Sum = 25.330  
Mean = 0.844 Variance = 0.086 Std.Dev. = 0.294  
Std.Error of Mean = 0.054  
Range = 1.000 Minimum = 0.000 Maximum = 1.000  
Skewness = -1.824 Std. Error of Skew = 0.427  
Kurtosis = 2.148 Std. Error Kurtosis = 0.833

FREQUENCY ANALYSIS BY BILL MILLER

Frequency Analysis for VAR1

FROM	UP TO	FREQ.	PCNT	CUM.FREQ.	CUM.PCNT.	%ILE RANK
0.00	1.00	9	0.30	9.00	0.00	0.15
1.00	2.00	21	0.70	30.00	1.00	0.65

Interval ND Freq.

1	9.87
2	18.69
3	1.29

NORMALITY TESTS FOR VAR1

Shapiro-Wilkes W = 0.6017  
Shapiro-Wilkes Prob. = 0.0000

Skew = -1.824

Kurtosis = 2.148

Lilliefors Test Statistic = 0.298

Conclusion: Strong evidence against normality.

The data's standard deviation, standard error, kurtosis, error of kurtosis and error of skew are in good range, but the negative skewness is quite high ( $-1.824 < -1$ ). The negative skewness means there are less but much smaller numbers than the more numerous larger numbers, so for a larger population or sample, the mean could be larger potentially if a larger and more standard sample or population are used that is the reason for the strong evidence against normality testing results. But because the sample size is greater than 30, the sample statistics is still relevant and useful.

The combined possibility of  $P(L1| Q1) = 0.749$ ;  $P(L2| Q2) = 0.54$ ;  $P(L3| Q3) = 0.88$  the researcher produced before is  $(0.749 + 0.54 + 0.88)/3 = 0.723$

To test the combined possibility of  $P(Lx| Qx)$  of 0.723 the researcher may treat the  $P(Lx| Qx)$  as a sample statistics because itself is derived from the same sample data by using the t test of  $(P(Lx| Qx) - 0.6(\text{hypothesized value})) / \text{standard error of the data} = (0.723 - 0.6) / 0.053 = 2.321$

The t test critical value for the degree of freedom of 29 with 99% confidence level is 2.756, so the combined possibility of  $P(Lx| Qx)$  is not different from the 60% possibility at 99% certainty, so the possibility is quite significant.

The researcher may also treat the combined possibility of  $P(Lx| Qx)$  of 0.723 as a hypothesized value and the mean possibility of the users as the sample statistics.  $(0.844 - 0.723) / 0.053 = 0.121/0.053 = 2.283$

The t test critical value for the degree of freedom of 29 with 99% confidence level is 2.756, so the combined possibility of  $P(Lx| Qx)$  is not different from the sample statistics at the 99% certainty, so the relationship between asked questions by users and their level of Chinese proficiency is significant at the 99% certainty and the questions may imply users' level of Chinese proficiency.

### **3 individual level users' sub tests**

Below is the sub data sample for each of the 3 level users and questions. The first sample is for level one users.

Participant	Px(La/Qb)
User 2	1
User 3	1
User 5	1
User 7	1
User 8	1
User 11	1
User 17	1
User 18	1
User 19	1
User 20	1
User 21	0.89
User 22	0.81
User 23	1
User 24	1
User 25	1
User 26	1
User 27	1
User 28	1
User 29	1
User 30	0.45

DISTRIBUTION PARAMETER ESTIMATES

VAR1 (N = 20) Sum = 19.150  
 Mean = 0.958 Variance = 0.017 Std.Dev. = 0.129  
 Std.Error of Mean = 0.029  
 Range = 0.550 Minimum = 0.450 Maximum = 1.000  
 Skewness = -3.649 Std. Error of Skew = 0.512  
 Kurtosis = 14.087 Std. Error Kurtosis = 0.992

FREQUENCY ANALYSIS BY BILL MILLER

Frequency Analysis for VAR1

FROM	UP TO	FREQ.	PCNT	CUM.FREQ.	CUM.PCNT.	%ILE RANK
0.45	1.45	20	1.00	20.00	0.00	0.50
1.45	2.45	0	0.00	20.00	1.00	1.00

The standard deviation and standard error are not problems here, but the skewness is -3.649 and the std error of skew is 0.512 that are all out side of normal rang, so the distribution is seriously skewed to the left by some very small but not many numbers. The actual mean from a larger and more normal sample and population could be potentially larger. The kurtosis is 14.087 that is much larger than the significant level of 3, so the distribution is very peaked in the middle and has fatter tails at two sides.

NORMALITY TESTS FOR VAR1

Shapiro-Wilkes W = 0.3885  
 Shapiro-Wilkes Prob. = 0.0000

Skew = -3.649

Kurtosis = 14.087

Lilliefors Test Statistic = 0.371

Conclusion: Strong evidence against normality.

The strong evidence against normality suggested by the normality tests is due to the large skewness and kurtosis numbers, but for skewness, it has potential larger mean than the current one with larger sample that might not necessarily be bad for the test.

Because the sample size is 20 and the sample is derived from a much larger (75) original raw data, the test is still meaningful but caution should be taken here.

To test the possibility of  $P(L1|Q1)$  of 0.749 the researcher may treat the  $P(L1|Q1)$  as a sample statistics because it is derived from the same original raw sample data by using the t test of  $(P(L1|Q1) - 0.6(\text{hypothesized value})) / \text{standard error of the data} = (0.749 - 0.6) / 0.029 = 5.138$

The t test critical value for the degree of freedom of 19 with 99.9% confidence level is 3.883, so the possibility of  $P(L1|Q1)$  is different from the 60% possibility at 99.9% certainty, so the possibility is not significant.

The researcher may also treat the possibility of  $P(L1|Q1)$  of 0.749 as a hypothesized value and the mean possibility of the users as the sample statistics.  $(0.958 - 0.749) / 0.029 = 0.121 / 0.053 = 7.2$

The t test critical value for the degree of freedom of 19 with 99.9% confidence level is 3.883, so the possibility of  $P(L1|Q1)$  is different from the sample statistics at the 99.9% certainty, so the relationship between asked questions by users and their level of Chinese proficiency is not significant at the 99.9% certainty and the questions may not imply users' level of Chinese proficiency.

Below is the sub test for the level 2 users.

Participant	Px(La/Qb)
User 6	0.22
User 9	1
User 10	0.15

#### DISTRIBUTION PARAMETER ESTIMATES

VAR1 (N = 3) Sum = 1.370  
Mean = 0.457 Variance = 0.223 Std.Dev. = 0.472  
Std.Error of Mean = 0.272  
Range = 0.850 Minimum = 0.150 Maximum = 1.000  
Skewness = 0.000 Std. Error of Skew = 0.000  
Kurtosis = 0.000 Std. Error Kurtosis = 0.000

The sample size is very small (3), but due to the fact that these three numbers are from the much larger original raw sample with a size of 49, so the statistics might still have its meaning.

To test the possibility of P(L2| Q2) of 0.54 the researcher may treat the P(L2| Q2) as a sample statistics because itself is derived from the same original raw sample data by using the t test of  $(P(L2| Q2) - 0.6(\text{hypothesized value})) / \text{standard error of the data} = (0.54 - 0.6) / 0.272 = -0.22$

The t test critical value for the degree of freedom of 2 with 99.9% confidence level is 31.6, so the possibility of P(L2| Q2) is not different from the 60% possibility at 99.9% certainty, so the possibility is significant.

The researcher may also treat the possibility of P(L2| Q2) of 0.54 as a hypothesized value and the mean possibility of the users as the sample statistics.  $(0.457 - 0.54) / 0.272 = -0.083 / 0.272 = -0.31$

The t test critical value for the degree of freedom of 2 with 99.9% confidence level is 31.6, so the possibility of  $P(L2|Q2)$  is not different from the sample statistics at the 99.9% certainty, so the relationship between asked questions by users and their level of Chinese proficiency is significant at the 99.9% certainty and the questions may imply users' level of Chinese proficiency.

Below is the test for level 3 users.

Participant	Px(La/Qb)
User 1	0.47
User 4	0
User 12	1
User 13	1
User 14	0.82
User 15	1
User 16	0.52

#### DISTRIBUTION PARAMETER ESTIMATES

VAR1 (N = 7) Sum = 4.810  
 Mean = 0.687 Variance = 0.143 Std.Dev. = 0.378  
 Std.Error of Mean = 0.143  
 Range = 1.000 Minimum = 0.000 Maximum = 1.000  
 Skewness = -1.057 Std. Error of Skew = 0.794  
 Kurtosis = 0.412 Std. Error Kurtosis = 1.587

#### NORMALITY TESTS FOR VAR1

Shapiro-Wilkes W = 0.8444  
 Shapiro-Wilkes Prob. = 0.1092

Skew = -1.057  
Kurtosis = 0.412  
Lilliefors Test Statistic = 0.204  
Conclusion: No evidence against normality.

This sample has passed the normality test, but the sample size of 7 is still small.

However due to the fact that these three numbers are from the much larger original raw sample with a size of 27, so the statistics might still have its meaning.

To test the possibility of  $P(L3|Q3)$  of 0.88 the researcher may treat the  $P(L3|Q3)$  as a sample statistics because itself is derived from the same original raw sample data by using the t test of  $(P(L3|Q3) - 0.6(\text{hypothesized value})) / \text{standard error of the data} = (0.88 - 0.6) / 0.149 = 1.88$

The t test critical value for the degree of freedom of 6 with 99.9% confidence level is 5.96, so the possibility of  $P(L3|Q3)$  is not different from the 60% possibility at 99.9% certainty, so the possibility is significant.

The researcher may also treat the possibility of  $P(L3|Q3)$  of 0.88 as a hypothesized value and the mean possibility of the users as the sample statistics.  $(0.687 - 0.88) / 0.149 = -0.19/0.149 = -1.3$

The t test critical value for the degree of freedom of 6 with 99.9% confidence level is 5.96, so the possibility of  $P(L3|Q3)$  is not different from the sample statistics at the 99.9% certainty, so the relationship between asked questions by users and their level of Chinese proficiency is significant at the 99.9% certainty and the questions may imply users' level of Chinese proficiency.

## 5. Discussion

## **5.1 Patterns, Trends and Causation**

The combined possibility  $P(Lx| Qx)$  and the 2 individual level 2 and level 3 possibilities are all significant from the t test the sample data, but the level 1 possibility is not significant. Therefore under most condition and for most time the researcher's theory of using the learners' questions talking with the robot may detect the Chinese language proficiency level is valid in accordance with the sample statistics and t test.

This may due to the fact that the questions user using may represent the unbiased real subconscious intention and the real level of their Chinese proficiency, because under such situation learners are more relaxed and freer to express and expose their real self-ego.

## **5.2 Research Limitations**

The t test and sample statistics are not perfect and there are many obvious shortcomings and weaknesses. The sample size is quite small at nine that may represent large bias. The classification of levels of Chinese proficiency may be not deep and broad enough. Some distributions are not or not close to normal, so this may discount and compromise the t-test validity. The nuance and details of the sample have not been totally dug. The using of the Bayes formula may not be perfect and accurate for the sample data.

The test of the relationship between the psychological factors and the questions user asked hasn't been explored. The test of the relationship among the user asked questions and their horizontally related courses and programmes, vertically related courses and programmes, complementary courses, programmes or products and the supplementary courses, programmes or products are not carried out due to the time strains. Finally the user asked questions and users' self-confidence level's relationship hasn't been tested.

## **6. Future Perspectives**

More defined and detailed Chinese proficiency levels can be used in the future. The aforementioned testing of questions asked and users' psychology; questions asked and horizontal related items; question asked and vertical related items as well as complementary and supplementary related items. The users' self-confidence level's effects will be tested too.

More complex and intelligent conversation pattern matching will be used; therefore users have a better chance of getting a direct and definite answer. Speech recognition will be implement soon, so no typing is necessary. More graphs, pictures, icons and metaphors will be utilised. Music and sound effects will be adventured as well.

Sample size could be enlarged and extended to increase t-test validity and test power. The increased size and materials will enhance the chance of finding new patterns, layers, nuance and subtlety and closer to normal distribution.

If time and resource allow, more activity and initiation oriented approaches may be taken. For example, we may take the pro and post Chinese learning assessment and survey approach to analyze the differences before and after the assessment and survey is taken. We may also use other research methods such as action research, focus group, etc.

## Appendices

OPENSTAT4 Version 13, Revision 4 (05/07/06)

OpenStat4 (OS4) is written in C++ using the Borland C++ Developer package version 5.0. In the spirit of "Open Source" software, this copy written program is available for free and may be redistributed to others as long as it is not for commercial purposes or resale and credit is given to the author(s).

OpenStat was originally written as an aid to students and teachers for introductory and advanced statistics courses, primarily in the social sciences. To insure that students and professionals, particularly in developing countries with very limited funding resources, have access to a package that completes nearly all of the analyses required in statistics courses, the package contains a wide variety of procedures for data analysis:

A spreadsheet-type of user interface in which variable labels are created (columns of a grid), and observed values are inserted into cells of rows for each case.

Descriptive statistics including central tendency and variability indexes, x-y plots, frequency distributions, breakdown, cross-tab, 3D rotation.

Pearson product-moment correlations and partial correlations.

Multiple Regression including stepwise forward and backward, simultaneous, block entry, best fit, Cox, Logistic, Weighted, 2-Stage

Analyses of variance including 1, 2 and 3 way ANOVAs, mixed design ANOVAs, Latin Square ANOVAs, Multivariate ANOVA and Analysis of Covariance.

Two and Three Way Cross-Classification analysis.

Multivariate analyses including Hierarchical, Factor Analysis, Canonical Correlation, and a least-squares General Linear Model procedure.

Non-Parametric analyses including Runs Test, Chi-Square, Fisher's Exact test, Kruskal-Wallis ANOVA, etc.

Measurement programs including Classical Reliability, Rasch 1-parameter scaling, 3-parameter IRT scaling, Successive Interval Scaling, etc.

Financial programs.

Simulation programs (random no. generators, correlations, 2-way ANOVA, distributions, z power and sample size estimates, etc.

A Neural Network program.

A matrix manipulation program.

Because the author has created this program as a hobby and is not a professional statistician, it is important that the user first tests the procedures with known textbook examples or compares (when possible) the output of an analysis to other commercial packages. No warranty can be made or implied that the results are correct. Sample data files (stored as TAB separated values) are available for experimentation. Users that have Excel or other software packages that can export tab, comma or space separated values files can import such files into OpenStat and make comparisons.

Updates are posted from time-to-time to correct known errors, add new procedures or improve user interface for the package. Check this site from time to time to insure that you are using the most current version. Report any problems or errors to the author so that updates can be made to correct the problems. If you are a frequent user of computer software, you are well aware that nearly all software packages have "bugs" or errors of some type that require maintenance or new versions to reduce these problems (e.g. Windows itself!) Send your "bug" reports and suggestions to:

Dr. William G. Miller

3705 NW 2nd Place

Ankeny, Iowa 50023

Or email comments to: [OpenStat@msn.com](mailto:OpenStat@msn.com)

The following are the links to the OS4 setup files for Windows and the source files should you wish to adapt any of the procedures for your own use. The InstallShield setup file is a .zip files of approximately 5 megabytes. The source file is

approximately 1 megabytes. The INNO setup file is a self-executing zip file of approximately 4 megabytes. The INNO setup does not appear to modify the register and may be preferred by users of networked computers.

OS4 Setup Files for Windows Using InstallShield

OS4 Source C++ Files for Windows

OS4 Sample Data Files

INNO OS4 Setup File

The textbook "Statistics and Measurement Using the free OpenStat Package" is available. It was written using Microsoft Office 2000 and is stored as a .zip file. Click on the link: [TEXTBOOK](#)

For a Portable Data File (.pdf) version, click on [TextBook](#).

While a Neural Network sub-system exists in OpenStat4, memory restrictions often can create a problem. For that reason, I have made the Neural Network procedure a separate program which should give the user more adequate space and fewer problems. Use the following link to download the stand-alone version.

NEURAL NETWORK

The source code is downloaded from: [NEURAL SOURCE](#) and a PDF file downloaded from [NEURAL PDF FILE](#)

If you are a user of the Linux operating system, you will find a similar program (LinOStat) by clicking on the following link:

[LinOStat](#).

Other Linux programs that may be of interest are available from the following links:

GradeBook

ItemBank

MatMan

Another Windows program I find useful for viewing my graphic files is PicView. For a link to this program click on: PICVIEW

Some of you are Visual Basic programmers. If you are interested in a "legacy" version of OpenStat written in Visual Basic version 4 some years ago, you can download the source and setup files of FreeStat. Click on the following links to download the zip files:

FreeStatSrc.zip

FreeStatSetup.zip

#### EXCELLENT SOURCES FOR FREE STATISTICS

<http://www.vipbg.vcu.edu/~mx/mxgui> A great matrix manipulation program and structural equations analysis program Mx.

<http://www.ghg.net/clips/CLIPS.html> Programs for Expert systems.

<http://freestatistics.altervista.org/stat.php> A source page of other free statistics software.

<http://www.angelfire.com/wv/bwhomedir/stats.html> A source of on-line books and other statistics software.

<http://www.personal.rdg.ac.uk/~snscolet/MScGLMs> On-line lectures on the generalized linear model.

<http://www.statistics.com/content/freesoft/AZlisting.html> Another source of free statistics software.

<http://149.170.199.144/multivar/intro.htm#Multivariate> An on-line introduction to multivariate statistics.

<http://obelia.jde.aca.mmu.ac.uk/multivar/lr.htm> On-line lecture on logistic regression.

<http://lib.stat.cmu.edu/modules> Another source of free statistics software and source code.

[http://www.pbarrett.net/statistics\\_corner.htm#Interrater](http://www.pbarrett.net/statistics_corner.htm#Interrater) Articles by Paul Barrett on a variety of statistics.

<http://www.personal.psu.edu/users/d/m/dmr/testing/testlinks.htm> Dennis Roberts Test/Scale construction links.

[http://www.southalabama.edu/coe/bset/johnson/dr\\_johnson/2textbook.htm](http://www.southalabama.edu/coe/bset/johnson/dr_johnson/2textbook.htm) Burke Johnson and Larry Christensen book and lectures on statistics concepts.

<http://gsociology.icaap.org/methods/soft.html> Additional links to statistical software and discussion group on OpenStat.

<http://oerl.sri.com> A source for project evaluation personnel.

<http://pareonline.net/getvn.asp?v=8&n=2> Link to Practical Assessment, Research and Evaluation on-line journal.

<http://www.education.umd.edu/EDMS/tutorials/FreeSoftware.html> Roberts site for Gummit and related software.

[http://statgen.iop.kcl.ac.uk/bgim/mle/sslike\\_1.html](http://statgen.iop.kcl.ac.uk/bgim/mle/sslike_1.html) S. Purcell's on-line book on Maximum Likelihood Estimation

<http://www.weibull.com/LifeDataWeb/lifedataweb.htm> On-line material on Life Data Analysis.

<http://www.visualstatistics.net> On-line text for visual statistics.

<http://forrest.psych.unc.edu/research/index.html> Forrest W. Young's ViSta program for visual statistics.

For other sources of free statistics see the excellent page maintained by John Pezzullo at: <http://www.statpages.org> John has several interactive Java language programs at his site that permit interactive analysis right on the web. For example, he has an excellent program for non-linear regression.

#### MY FAVORITE FREE SOFTWARE

The following software is exceptional! I encourage you to download and explore their capability.

PAST version 0.45. This is an excellent statistics package and includes multiple multivariate and univariate procedures. I particularly like to choice of the cluster analysis procedures. Go to <http://www.uio.no/~ohammer/past> for the download.

Khi3 - 1.1.1 . This is a desktop calculator with great features! It includes games, star maps, conversions, and all kinds of calculations. A great package. Go to <http://www.1dustrie.com> for the download of the free version.

Mxgui32. See the reference link in the above listing of sites. This package has great use for the investigation of causal patterns.

Do you need to convert your music CD's to MP3 files for you listening pleasure while computing? This great little program will read the tracks directly from your CD and convert to MP3 files. You can also convert your older vinyl records!  
<http://www.audiograbber.com-us.net/>

PERSONAL NOTE: I have been retired since 1997. I have muscular dystrophy and am also receiving radiation for cancer. While I wish to continue the development of OpenStat, I am finding that my pension is strained with all of my additional costs. While I wish to keep this a free package, I would welcome donations of any size to help sustain my efforts. Anything would be welcome.
