National College of Ireland
Project Submission Sheet – 2019/2020

Student Name: Smit Jain

Student ID: 18135340

Programme: MSc in Data Analytics **Year:** 2019-2020

Module: Configuration module for research project

Lecturer: Dr. Pierpaolo Dondio

Submission Due Date: 12/12/2019

Project Title: Analysing effect of Twitter Tweets, Oil Prices, Gold Prices and Foreign Exchange on S&P500 Using Machine Learning.

Word Count: 1201

I hereby certify that the information contained in this (my submission) is information pertaining to research I conducted for this project. All information other than my own contribution will be fully referenced and listed in the relevant bibliography section at the rear of the project.

ALL internet material must be referenced in the references section. Students are encouraged to use the Harvard Referencing Standard supplied by the Library. To use other author's written or electronic work is illegal (plagiarism) and may result in disciplinary action. Students may be required to undergo a viva (oral examination) if there is suspicion about the validity of their submitted work.

Signature: Smit Jain

Date: 11/12/2019

PLEASE READ THE FOLLOWING INSTRUCTIONS:

1. Please attach a completed copy of this sheet to each project (including multiple copies).
2. Projects should be submitted to your Programme Coordinator.
3. **You must ensure that you retain a HARD COPY of ALL projects**, both for your own reference and in case a project is lost or mislaid. It is not sufficient to keep a copy on computer. Please do not bind projects or place in covers unless specifically requested.
4. You must ensure that all projects are submitted to your Programme Coordinator on or before the required submission date. **Late submissions will incur penalties.**
5. All projects must be submitted and passed in order to successfully complete the year. **Any project/assignment not submitted will be marked as a fail.**

1. Introduction to configuration manual:

This configuration manual can be used to replicate the work done by the author and get the desired results. The manual includes the system configuration requirements, the steps to gather the data, clean the gathered data and then use the data to implement the models and use evaluation criteria to compare the results of different models. The code snippets are attached in the last section.

2. Pre-requisites and system configuration:

The tools and software used for this thesis research work can be installed on a laptop or a PC. The basic configuration list is given below:

Operating system	Windows 10
RAM	8 GB
Hard Disk	512 SSD
Processor	Core i7 8 th gen

Getting started:

The basic toolset used in this research work for carrying out all the actions are listed below:

- Microsoft office tools
- Python 3.7
- Anaconda Spyder

The Microsoft office tools like Microsoft Excel and Word have been used. Python as a language has been used for this research work and all the processes like data gathering, data cleaning, transformation and analysis has been done in python language. The software version for python used is 3.7 and the latest version can be downloaded anytime for free from the website – '<https://www.python.org/downloads/>'. The platform used for coding is Anaconda. Anaconda can be downloaded from the link – 'https://repo.anaconda.com/archive/Anaconda3-2019.10-Windows-x86_64.exe'. Spyder has been used in the anaconda platform because it is very convenient to use, and all the variables can be seen in the variable explorer which makes it easy when data cleaning and manipulations are being done.

3. Dataset generation:

The datasets generated for this research work are –

1. Stock Market data set:

This dataset has been taken from Yahoo finance (Figure 1). On the website (<https://finance.yahoo.com/quote/%5EGSPC/history?p=%5EGSPC>), we can select the time period and the daily data for the time period selected can be downloaded in csv format. The dataset downloaded is suitable for a time-series analysis.

Date	Open	High	Low	Close*	Adj Close**	Volume
Dec 06, 2019	3,134.62	3,150.60	3,134.62	3,145.91	3,145.91	1,699,014,299
Dec 05, 2019	3,119.21	3,119.45	3,103.76	3,117.43	3,117.43	3,355,750,000

Figure 1: Yahoo!finance data set gathering

2. Twitter data set:

This data set has been generated using twitter. The data has been scraped from twitter using the python command on anaconda command prompt. The command used is – ‘twitterscraper ”#SP500” -l 10000 -bd 2018-01-01 -ed 2019-01-01 -o tweets.json’. This command (Figure 2) will scrape the twitter data for the specified timeframe and a .json file will be created. Next, this json file is imported in python and converted into a csv and then operated and the dataset is cleaned (Figure 3). The dataset downloaded is suitable for a time-series analysis.

```

Anaconda Prompt
(base) C:\Users\Smit>twitterscraper "#SP500" -l 10000 -bd 2018-01-01 -ed 2019-01-01 -o tweets.json
(base) C:\Users\Smit>

```

Figure 2: Twitterscraper, scraping tweets using Anaconda prompt

```

1 import codecs, json, csv
2 import pandas as pd
3
4 #read a json file downloaded with twitterscraper
5 with codecs.open('tweets18SnP500_3.json', 'r', 'utf-8') as f:
6     All_Tweets = json.load(f, encoding='utf-8')
7
8 #tweets is now a list of tweets
9 #save into a csv
10 file = "tweets18SnP500_3.csv" #file name
11
12 #open csv file for append
13 target_file = open(file, 'w', encoding='utf-8', newline='')
14 csv_file = csv.writer(target_file, delimiter=',', quotechar='"')
15 count=0 #a counter
16 i = 0 #a counter
17
18 eng_tweet = pd.DataFrame()
19 eng_tweet['timestamp'] = None
20 eng_tweet['likes'] = None
21 eng_tweet['content'] = None
22 eng_tweet['language'] = None
23
24 for tweet in All_Tweets:
25     eng_tweet.loc[i, 'timestamp'] = tweet['timestamp']
26     eng_tweet.loc[i, 'likes'] = tweet['likes']
27     eng_tweet.loc[i, 'content'] = tweet['text']
28     eng_tweet.loc[i, 'count'] = i
29     if (tweet['html'].find('lang="en"') != -1):
30         eng_tweet.loc[i, 'language'] = "ENGLISH!!!"
31     else:
32         eng_tweet.loc[i, 'language'] = "NON ENGLISH!!!"
33     i = i + 1
34     count=count+1
35
36 #write to the csv (not required)

```

Figure 3: code snippet to convert the json file and clean the dataset.

4. Research design workflow and methodology:

In this research work, the datasets have been first extracted from their sources and then imported in python for doing the cleaning. After the datasets are cleaned, a test known as Granger Causality test has been done to check the causality of different variables in the prediction of the stock market index. After the test, the twitter dataset is found to be a causal for the prediction of stock market hence, the twitter dataset along with the stock market dataset is used in various models for the prediction. After the predictions are made, the results are evaluated using MSE, RMSE, MAE and MAPE which are standard protocols for any time series prediction models. The design flowchart (Figure 4) is given below:

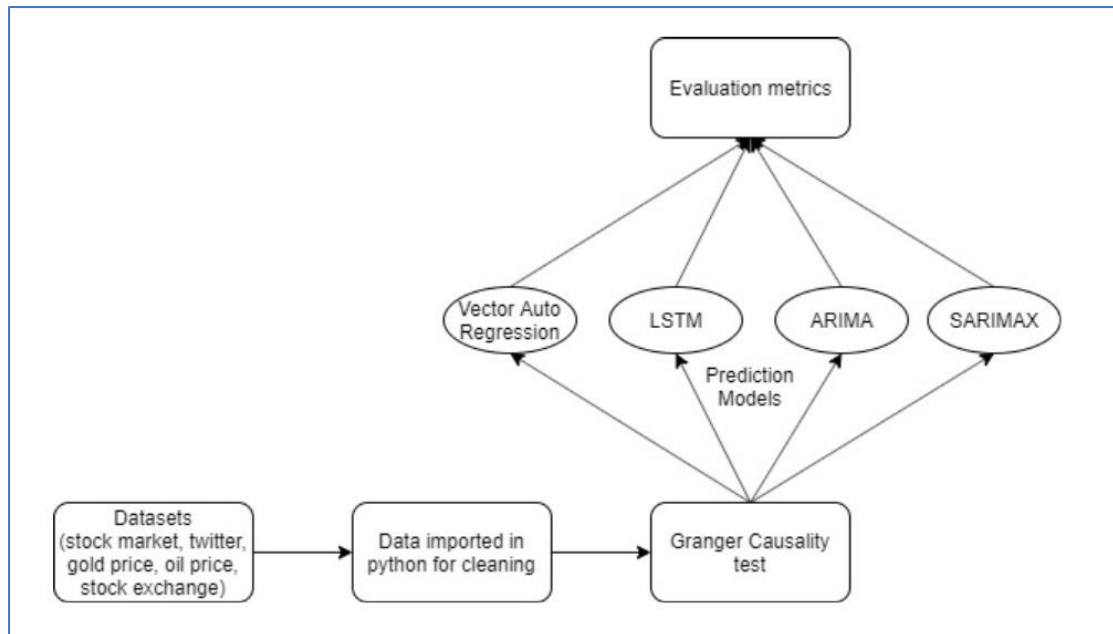

Figure 4: Design flowchart

5. Libraries used in code:

- import codecs, json, csv – these libraries have been used to deal with the tweets downloaded in json format and then convert them into a csv.
- import pandas as pd – Pandas library used for calculations and data manipulations.
- import warnings – library used to implement alerts
- import itertools – library used for iterating through loops
- import numpy as np – library used for performing mathematical functions
- import matplotlib.pyplot as plt – library used for plotting graphs
- import statsmodels.api as sm – library used for implementing statistical models
- from sklearn.metrics import mean_absolute_error, mean_squared_error – used for calculating MAE and MSE.
- import math – library for performing mathematical operations
- from statsmodels.tools.eval_measures import rmse, aic – library used for calculating RMSE values
- %matplotlib inline – the plots are plotted in line
- import os - imports miscellaneous interfaces of the operating system
- import seaborn as sb – library used for data visualization
- import re- the regex library
- from sklearn import preprocessing – library used for data preprocessing
- from functools import reduce – function used for performing computations on a list
- from statsmodels.tsa.api import VAR – for applying the VAR model
- from statsmodels.tsa.stattools import adfuller – used for conducting adfuller test
- from scipy import stats – for applying statistical functions
- sb.set_style('darkgrid') – for setting style in seaborn
- from pmdarima import auto_arima – for calculating the auto arima score
- from statsmodels.tsa.arima_model import ARIMA – to implement ARIMA model.

6. Implemented models (Code snippets):

The models implemented in this research work are VAR, LSTM, ARIMA and SARIMAX. The code snippets for each of the model implemented is given below.

1. Vector Auto Regressor (VAR) model:

The code snippet for this model is given below.

```
1 print('STOCK PREDICTION USING RNN LSTM')
2 import numpy as np
3 import pandas as pd
4 from sklearn import preprocessing
5 from functools import reduce
6 import matplotlib.pyplot as plt
7 from statsmodels.tsa.api import VAR
8 from statsmodels.tsa.stattools import adfuller
9 from statsmodels.tools.eval_measures import rmse, aic
10 from sklearn.metrics import mean_absolute_error, mean_squared_error
11 import math
12 %matplotlib inline
13 #####
14 # Load the dataset
15 #####
16 SMdata= pd.read_csv('C:/Users/Smit/Dataset/yahoo/stockMarket.csv')
17 TWratio = pd.read_csv('C:/Users/Smit/PosRatioTweets.csv')
18 TWvol = pd.read_csv('C:/Users/Smit/TWvol.csv')
19 #merge all the datasets
20 data_frames = [SMdata, TWratio, TWvol]
21 data_csv = reduce(lambda left,right: pd.merge(left,right,on=['Date'],
22                                             how='outer'), data_frames)
