PLEASE READ THE FOLLOWING INSTRUCTIONS AND CHECKLIST

| Attach a completed copy of this sheet to each project (including multiple | |
|--|--|
| copies) | |
| Attach a Moodle submission receipt of the online project | |
| submission, to each project (including multiple copies). | |
| You must ensure that you retain a HARD COPY of the project, both | |
| for your own reference and in case a project is lost or mislaid. It is not | |
| sufficient to keep a copy on computer. | |

Assignments that are submitted to the Programme Coordinator Office must be placed into the assignment box located outside the office.

| Office Use Only | |

Configuration Manual

Shrey Sanjay Shah x18192271

1 Introduction

This configuration manual gives comprehensive set of procedures required to be followed in order to replicate the proposed research and achieve identical results. The manual includes various sections such as minimum software configuration required, steps to replicate sub parts of this research such as pre-processing, transformation, implementation as well as evaluation.

2 System Requirement

All the required tools and software for this research can be easily installed in any computer system having basic configuration list given below:

| Operating System | Windows 10 |
|------------------|-------------------------------------|
| RAM | 8GB+ |
| Hard Disk | 256GB SSD |
| Processor | Intel Core i5 8 th gen + |

All the basic tools / software requires for implementation of this research are listed below:

- a. Microsoft Office Suite
- b. Python 3.7
- c. Anaconda Jupyter Notebook

From Microsoft Office suite, MS Excel and MS word were used for data viewing, selection and reporting. Python is the core programming language used for the purpose of this research. For the purpose of this research python 3.7 was used which could be downloaded for free from their official website¹. The platform used for programming in python was Anaconda which is again freely available to download from their website². The program called Jupyter notebook from the Anaconda Navigator was used. The advantages of Jupyter Notebooks are ease of use, fast implementation, portability, etc.

¹ <u>https://www.python.org/downloads/</u>

² https://repo.anaconda.com/archive/Anaconda3-2020.07-Windows-x86 64.exe

3 Dataset Selection

The Orange telecom's datasets were made available on KDD championship data ³ but the same data was processed and reuploaded⁴⁵ with 2 different datasets from the same company. This processed data had all the redundant features eliminated and only the required features for churn prediction were kept.

4 Importing required libraries and datasets

All the required libraries are imported and dataset is imported and viewed as well as shown below.

³ https://www.kdd.org/kdd-cup/view/kdd-cup-2009/Data

⁴ https://bml-data.s3.amazonaws.com/churn-bigml-80.csv

⁵ https://bml-data.s3.amazonaws.com/churn-bigml-20.csv

5 Pre-processing

All the redundant features were eliminated, new attributes necessary for future implementation of the model were calculated and some datatypes were changed for ease of use further.

6 CLV Calculation Model

4 attributes are calculated before getting the final CLV scores. After getting final CLV score the updated dataset is stored in csv format in order to retrieve the updated data whenever necessary.

7 CLV Clustering Model

In this model, the customers are grouped in clusters based on their CLV scores. Also the most optimal number of clusters is selected to be 5 using the elbow method. The clusters are arranged in ascending order to ease mapping in further steps.

Resulting cluster shown with the help of scatter plot

Sorting clusters:

Sorting CLV based clusters in ascending order

8 Churn Prediction Model

The dataset was viewed, redundant columns for churn prediction were eliminated and correlation matrix was used to eliminate highly correlated columns finally churn prediction model was implemented with the help of decision tree classifier and the results were evaluated based on multiple evaluation metrics.

Reviewing the data for churn prediction

10 Discount Model

Probable churners are mapped to their CLV scores and appropriate offers/ discounts are generated.
