National College of Ireland
MSc Project Submission Sheet
School of Computing

Student Name: Keith Cooney
Student ID: 18201270
Programme: MSc in Cybersecurity **Year:** 2021
Module: Research Project
Lecturer: Dr Imran Khan
Submission Due Date: 20th September 2021
Project Title: Operational Technology Intrusion Detection Application for Power Grid Security Operation Centre
Word Count: **2244** **Page Count:** **26**

I hereby certify that the information contained in this (my submission) is information pertaining to research I conducted for this project. All information other than my own contribution will be fully referenced and listed in the relevant bibliography section at the rear of the project.

ALL internet material must be referenced in the bibliography section. Students are required to use the Referencing Standard specified in the report template. To use other author's written or electronic work is illegal (plagiarism) and may result in disciplinary action.

Signature: Keith Cooney
Date: 20th September 2021

PLEASE READ THE FOLLOWING INSTRUCTIONS AND CHECKLIST

Attach a completed copy of this sheet to each project (including multiple copies)	<input type="checkbox"/>
Attach a Moodle submission receipt of the online project submission, to each project (including multiple copies).	<input type="checkbox"/>
You must ensure that you retain a HARD COPY of the project, both for your own reference and in case a project is lost or mislaid. It is not sufficient to keep a copy on computer.	<input type="checkbox"/>

Assignments that are submitted to the Programme Coordinator Office must be placed into the assignment box located outside the office.

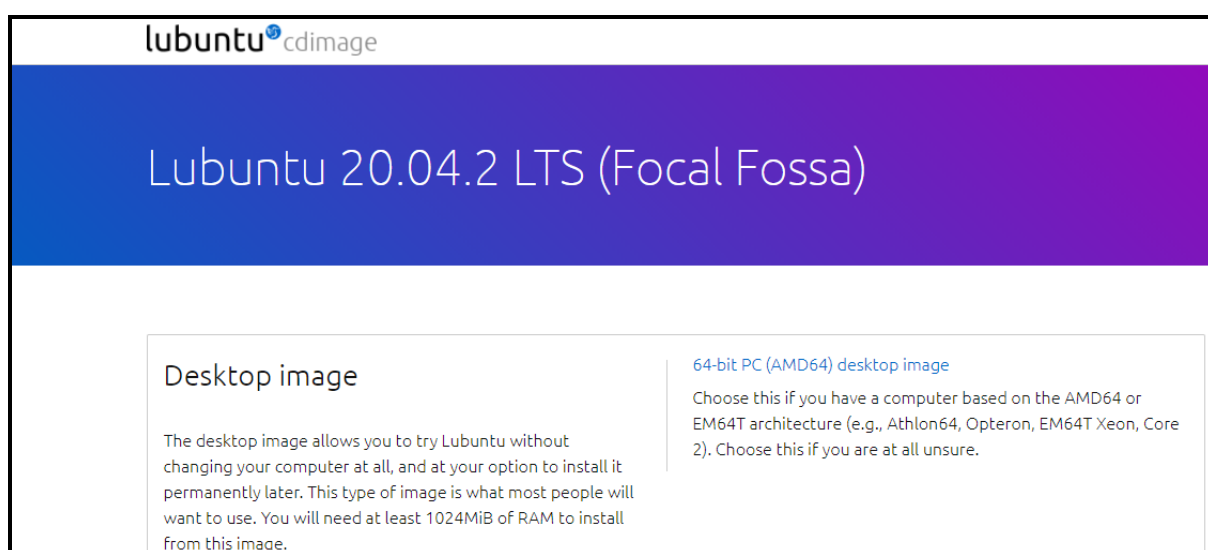

Office Use Only

Date:	
Penalty Applied (if applicable):	

Configuration Manual

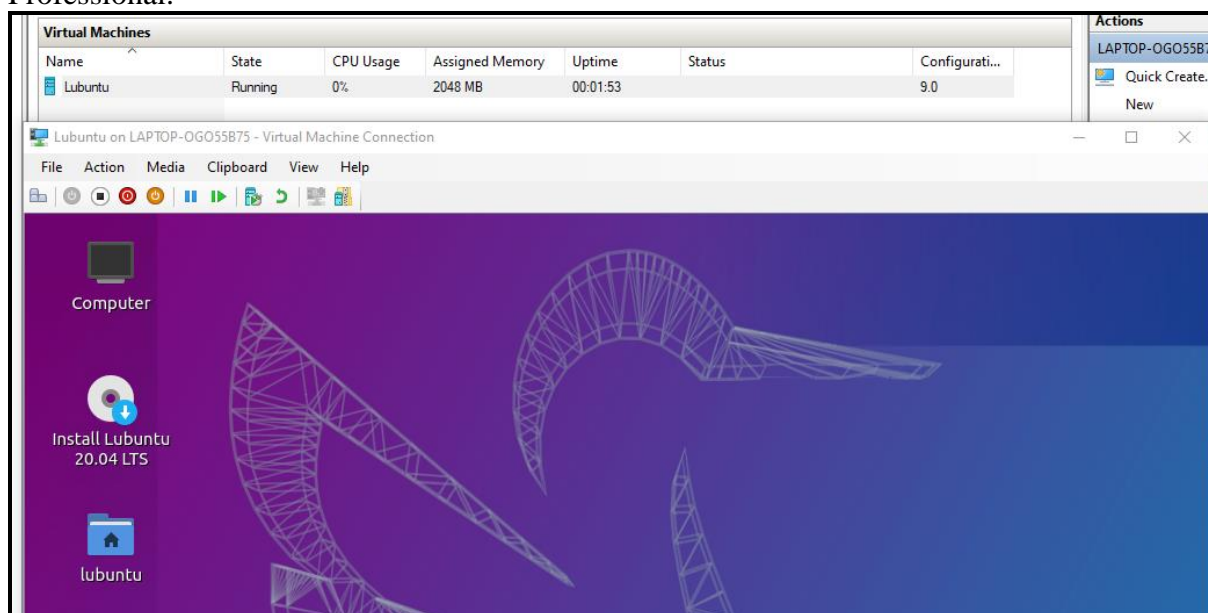

Keith Cooney
Student ID: 18201270

1 Setting up Virtual Machine

Download the Lubuntu ISO for AMD processors. Lubuntu was chosen as it is a lightweight operating system. Refer to (Lubuntu, 2021)

The Lubuntu ISO file was run using Hyper-V Hypervisor that can be run in Windows 10 Professional.

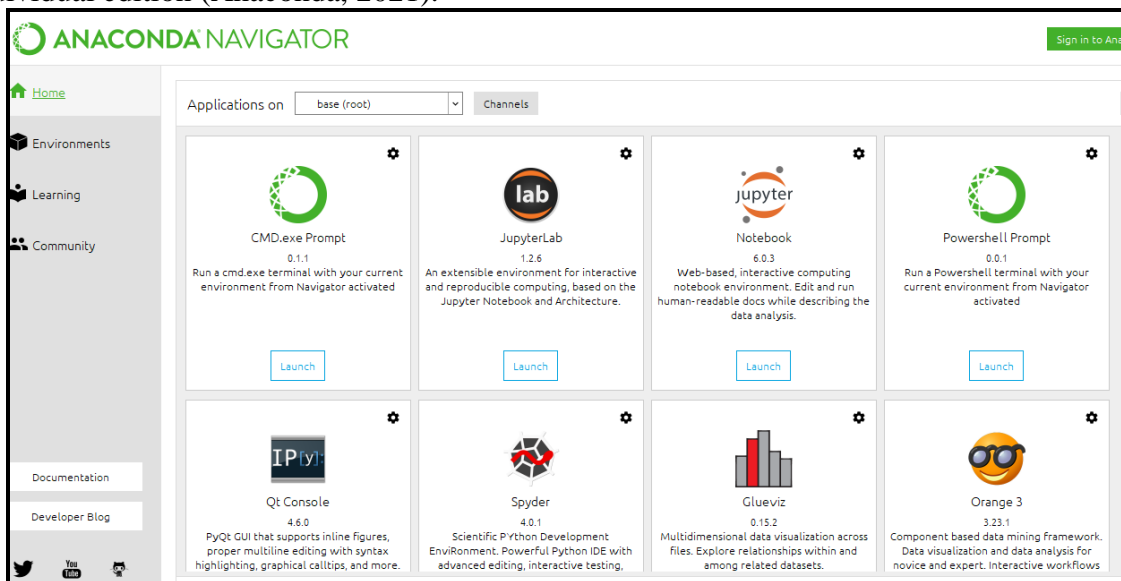

Using the terminal in Lubuntu – download and install the MYSQL Server application.

Instructions to install the MySQL Server were referenced in (Digital Ocean, 2021)

```
sudo apt install mysql-server
```

Downloading Python Environment on Windows 10 Host – *Anaconda*. Use the open-source individual edition (Anaconda, 2021).

Using the Spyder application, the Python scripts were developed.

2 Datasets

Raw Datasets (Samples):

Due to the size of the dataset only a sample is shown here. The SCADA dataset has many thousands of rows. Important to note the 3rd column. This represents time.

Problem:

DateTime type in MYSQL does not correspond to the SCADA dataset time format which is [12-03-2021 13:18:16] However, MySQL uses [2021-03-12 13:18:16].

Solution:

Pre-process the excel events list with a method of conversion via =TEXT(A4,"YYYY-MM-DD HH:MM:SS"). This can be then imported into the MYSQL database.

SCADA Power Grid Events Dataset:

Understanding the Datasets:

Important to understand how the datasets format the raw data. Need to know where we are likely to find certain data fields when it is delimited. This is the basis for using the Python Pandas data frames. See below for example of how the data is formatted with respect to expected field and character lengths.

11Characters8Characters	11Characters4Characters21Characters26Characters63Characters
12/03/2021 10:54	SALLSFORD_ 11 T67 OVD ALARM ON

3 Inputting the Databases to MySQL

Note the difficulty with importing dates of a different format into MYSQL. Use the STR_TO_DATE function for loading difficult datetime formats in csv file (StackOverFlow, 2021).

```
mysql> LOAD DATA LOCAL INFILE "/home/scada/Desktop/idsanonSYSlogs.csv" INTO TABLE idsanonsyslog.
syslogs FIELDS TERMINATED BY ',' LINES TERMINATED BY '\n' IGNORE 1 LINES (Id, @var, Event) SET d
atetime=STR_TO_DATE(@var, '%Y-%m-%d %k:%i:%s');
```

Inputting a Dataset into MySQL (for example simulated 'Scada' system).

To enter MySQL use

- sudo -i

Then type:

- mysql -u root -p

```
scada@scada-virtualmachine:~$ sudo -i
root@scada-virtualmachine:~# mysql -u root -p
Enter password:
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 28
Server version: 8.0.25-0ubuntu0.20.04.1 (Ubuntu)

Copyright (c) 2000, 2021, Oracle and/or its affiliates.

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.
```

Show the Existing Databases

```
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| Login    |
| PowerEventList |
| PowerEventList2 |
| PowerEventList3 |
| PowerEventList4 |
| information_schema |
| mysql    |
| performance_schema |
| sys      |
+-----+
9 rows in set (0.00 sec)

mysql>
```

Prepare to Create a new database. Exit out of MySQL and login again with the local-infile parameter.

After login enter the command: SHOW GLOBAL VARIABLES 'local_infile';.

```
root@scada-virtualmachine:~# mysql -u root -p --local-infile
Enter password:
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 34
Server version: 8.0.25-0ubuntu0.20.04.1 (Ubuntu)

Copyright (c) 2000, 2021, Oracle and/or its affiliates.

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.

mysql> SHOW GLABAL VARIABLES LIKE 'local_infile';
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'GLABAL VARIABLES LIKE 'local_infile'' at li
ne 1
mysql> SHOW GLOBAL VARIABLES LIKE 'local_infile';
+-----+
| Variable_name | Value |
+-----+
| local_infile  | OFF   |
+-----+
1 row in set (0.00 sec)

mysql>
```

Set the Local_infile Parameter to 1 (this prepares the database for input of formatted data)

```
mysql> SET GLOBAL local_infile=1;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW GLOBAL VARIABLES LIKE 'local_infile';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| local_infile  | ON    |
+-----+-----+
1 row in set (0.00 sec)

mysql>
```

Create new Database and associated Table: New Database is called 'PowerEventListAnon'

Select the Database and create the Table 'PowerTableAnon'

```
mysql> CREATE DATABASE PowerEventListAnon;
Query OK, 1 row affected (0.01 sec)

mysql> USE PowerEventListAnon;
Database changed
mysql> CREATE TABLE PowerTableAnon (Id int(10) NOT NULL, datetime DATETIME, event CHAR(150));
Query OK, 0 rows affected, 1 warning (0.03 sec)

mysql>
```

Exit out of MySQL and restart the service from Linux command line:

- Sudo systemctl restart mysql.service

```
mysql> exit
Bye
root@scada-virtualmachine:~# sudo systemctl restart mysql.service
root@scada-virtualmachine:~#
```

Load the file to the database:

Enter MySQL. You will need to set the local_infile parameter back to 1 again. Load the data to the Database.Table in with the commands below.

There may be a permission issue. Enter the following for local infile.

```
scada@scada-virtualmachine:~$ sudo mysql --local-infile=1 -u root -p
[sudo] password for scada:
Enter password:
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 9
Server version: 8.0.25-0ubuntu0.20.04.1 (Ubuntu)
```

The command to enter the data into MySQL is:

```
LOAD DATA LOCAL INFILE "/home/scada/Desktop/MYSQLANONYMOUS.csv" INTO TABLE
PowerEventListAnon.PowerTableAnon FIELDS TERMINATED BY ',' LINES TERMINATED BY '\n'
IGNORE 1 LINES (Id, DateTime, Event);
```

```

mysql> LOAD DATA LOCAL INFILE "/home/scada/Desktop/MYSQLANONYMOUS.csv" INTO TABLE PowerEventListAnon
n.PowerTableAnon FIELDS TERMINATED BY ',' LINES TERMINATED BY '\n' IGNORE 1 LINES (Id, DateTime, Ev
ent);
ERROR 3948 (42000): Loading local data is disabled; this must be enabled on both the client and ser
ver sides
mysql> SHOW GLOBAL VARIABLES LIKE 'local_infile';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| local_infile  | OFF   |
+-----+-----+
1 row in set (0.00 sec)

mysql> SET GLOBAL local_infile=1;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW GLOBAL VARIABLES LIKE 'local_infile';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| local_infile  | ON    |
+-----+-----+
1 row in set (0.00 sec)

mysql> LOAD DATA LOCAL INFILE "/home/scada/Desktop/MYSQLANONYMOUS.csv" INTO TABLE PowerEventListAno
n.PowerTableAnon FIELDS TERMINATED BY ',' LINES TERMINATED BY '\n' IGNORE 1 LINES (Id, DateTime, Ev
ent);
Query OK, 32703 rows affected (0.28 sec)
Records: 32703 Deleted: 0 Skipped: 0 Warnings: 0

mysql>

```

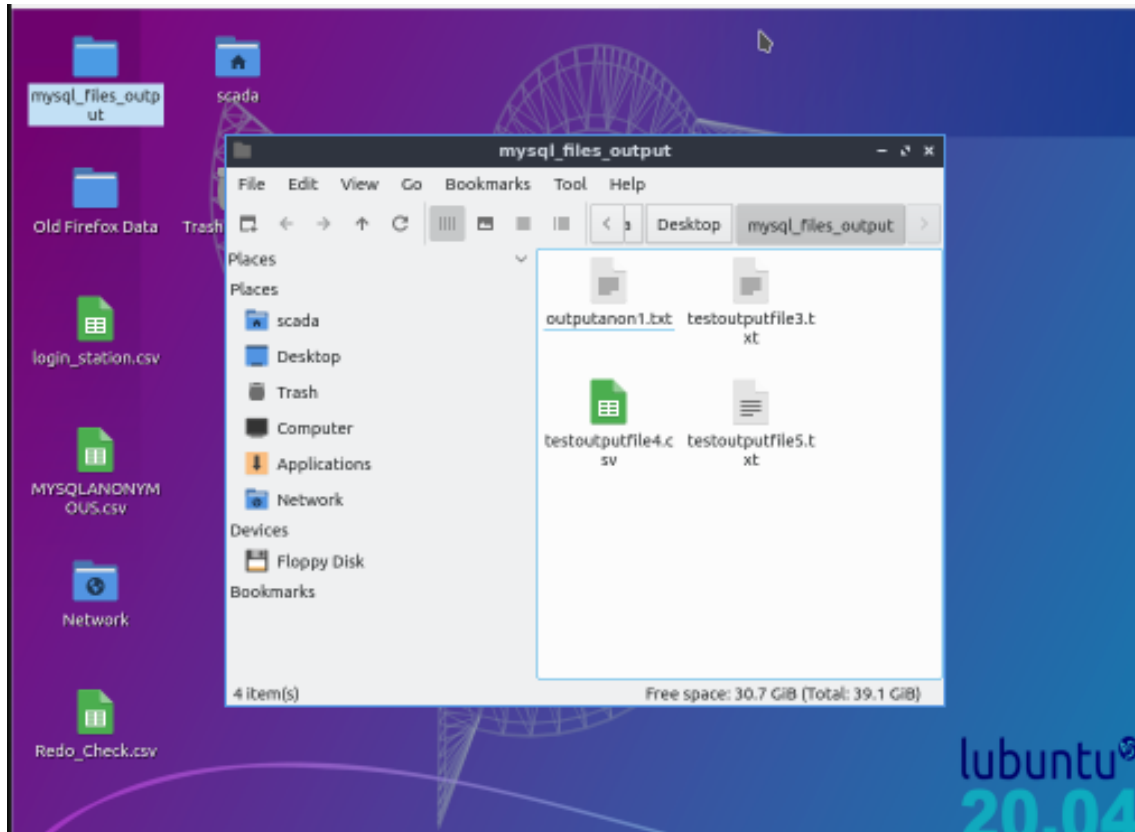

Check the data is in the database:

- Mysql> USE DATABASE PowerEventListAnon;
- Mysql> SELECT ALL* FROM Events.

Copy it to the desktop folder for convenient access.

```
root@scada-virtualmachine:~# sudo cp /var/lib/mysql-files/outputanon1.txt /home/scada/Desktop/mysql_files_output/outputanon1.txt
root@scada-virtualmachine:~#
```

Then it is in desktop folder mysql_files_output.

Set permissions for other Users to query the database. For example, we can set permission for Users 'scada' and 'ids'. We can also associate the user with an IP address. If User 'ids' is a remote user on another Host (with IP Address 10.10.10.20) then permissions can be setup accordingly to access the database from the remote host. The 'scada' is associated with IP address 10.10.10.10.

```
GRANT ALL PRIVILEGES ON PowerEventListAnon TO 'ids'@'10.10.10.20';
```

```
GRANT ALL PRIVILEGES ON PowerEventListAnon TO 'scada'@'10.10.10.10';
```

```
mysql> USE PowerEventListAnon;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Database changed
mysql> GRANT ALL PRIVILEGES ON PowerEventListAnon TO 'ids'@'10.10.10.20';
Query OK, 0 rows affected (0.01 sec)

mysql> GRANT ALL PRIVILEGES ON PowerEventListAnon TO 'scada'@'10.10.10.10';
Query OK, 0 rows affected (0.00 sec)

mysql> GRANT ALL PRIVILEGES ON PowerEventListAnon TO 'user'@'localhost';
Query OK, 0 rows affected (0.01 sec)

mysql> FLUSH PRIVILEGES;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'PRIVILEGES' at line 1
mysql> FLUSH PRIVILEGES;
Query OK, 0 rows affected (0.00 sec)

mysql>
```

Also, grant permission to the table PowerTableAnon. Example for user 'ids' is below.'

```
mysql> GRANT ALL PRIVILEGES ON PowerTableAnon TO 'ids'@'10.10.10.20';
Query OK, 0 rows affected (0.01 sec)

mysql>
```

Exit MySQL and restart services:

- Sudo systemctl restart mysql.service

Enter the 'Site Login Dataset' to correlate against the SCADA Power Events.

Like the way the PowerEventListAnon Database, create Database 'Login' using appropriate fields. Select 'Use Login' Database.

```
mysql> USE Login
```

Create the Table 'Stationlog_anon' with fields as follows:

```
mysql> CREATE TABLE Stationlog_anon (datetime DATETIME, log CHAR(5), plant CHAR(11), name VARCHAR(50));
Query OK, 0 rows affected (0.02 sec)

mysql>
```

Grant ALL Privileges for user ids for both database Login and the new table 'Stationlog_anon'.

```
mysql> GRANT ALL PRIVILEGES ON Login TO 'ids'@'%';
Query OK, 0 rows affected (0.00 sec)

mysql> GRANT ALL PRIVILEGES ON Login TO 'ids'@'10.10.10.20';
Query OK, 0 rows affected (0.01 sec)

mysql> GRANT ALL PRIVILEGES ON Stationlog_anon TO 'ids'@'10.10.10.20';
Query OK, 0 rows affected (0.00 sec)

mysql> █
```

Also, perform this for 'Scada' user.

```
mysql> GRANT ALL PRIVILEGES ON Stationlog_anon TO 'scada'@'10.10.10.10';
Query OK, 0 rows affected (0.00 sec)

mysql> GRANT ALL PRIVILEGES ON Login TO 'scada'@'10.10.10.10';
Query OK, 0 rows affected (0.00 sec)

mysql> FLUSH PRIVILEGES;
Query OK, 0 rows affected (0.01 sec)
```

Also remember to 'FLUSH PRIVILEGES'.

Exit MySQL and restart services:

- Sudo systemctl restart mysql.service

Load the Infile stored on the desktop (called anon_login1.csv)

```
mysql> LOAD DATA LOCAL INFILE "/home/scada/Desktop/anon_login1.csv" INTO TABLE Login.Stationlog_anon
FIELDS TERMINATED BY ',' LINES TERMINATED BY '\n' IGNORE 1 LINES (datetime, log, plant, name);
Query OK, 26 rows affected (0.01 sec)
Records: 26 Deleted: 0 Skipped: 0 Warnings: 0

mysql> █
```

Enter the 'Syslog Dataset' to correlate against the SCADA Power Events.

Create the new Table for the syslog dataset.

```
mysql> CREATE TABLE syslogs (id int(5), datetime DATETIME, event CHAR(150));
```

Like the method for the previous database tables. Select the Database and load the raw data from the dataset 'idsanonSYSlog.csv' to the new table 'Syslogs' as follows:

```
mysql> LOAD DATA LOCAL INFILE "/home/scada/Desktop/idsanonSYSlogs.csv" INTO TABLE idsanonsyslog.
syslogs FIELDS TERMINATED BY ',' LINES TERMINATED BY '\n' IGNORE 1 LINES (Id, @var, Event) SET d
atetime=STR_TO_DATE(@var, '%Y-%m-%d %k:%i:%s');
```

Also, grant permission to the table idsanonsyslog.syslogs. Then Flush Privileges.

4 Mechanism to Query the Databases from Application

The Python IDS application will be running on the Windows 10 Machine. The Ubuntu Operating System that is hosting the MySQL Database is a guest OS virtualised via the Hyper-V hypervisor supplied under Windows 10 professional. For the Python IDS application to access the data held within the MySQL database tables, the application will use an SSH tunnel module to connect securely to the remote database and query the databases as needed. To import the required packages to implement the SSH tunneller module the following steps were performed using the Anaconda Environment.

SSH Tunnelling with Python to Remote Computer: Download SSH Tunnel module in the Anaconda environment (pypi.org, 2021).

```
Installation

sshtunnel is on PyPI, so simply run:

pip install sshtunnel

or

easy_install sshtunnel

or

conda install -c conda-forge sshtunnel
```

Also install module for pymysql (Anaconda.org, 2021).

```
To install this package with conda run:

conda install -c anaconda pymysql
```

For different versions of the SSH Tunneler we also need to import (Geeksforgeeks.org, 2021):

```
conda install -c anaconda mysql-python
conda install -c anaconda mysql-connector-python
```

Unfortunately mysql-python may not install due to incompatibility with Python 3.7. In order to get the necessary package to work (i.e. Mysqlldb) we need to do a pip install on the anaconda base command line i.e.

```
(base) PS C:\Users\sando> pip install mysqlclient
Collecting mysqlclient
  Downloading mysqlclient-2.0.3-cp37-cp37m-win_amd64.whl (178 kB)
    |████████████████████████████████████████| 178 kB 726 kB/s
Installing collected packages: mysqlclient
Successfully installed mysqlclient-2.0.3
(base) PS C:\Users\sando>
```

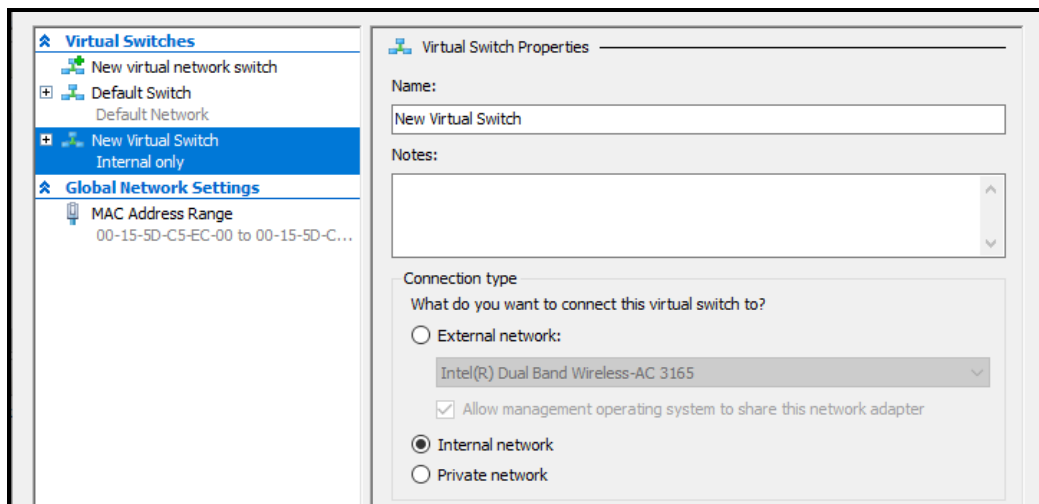

This will enable the SSH Tunneler program to work and query the remote database via select and store to the Pandas dataframes.

For the code to open the SSH tunnel refer to the StackOverflow forum (Stackoverflow, 2021).

The SSH Tunneller module can be referred to in the Python Implementation Section.

5 Windows 10 Host connection to Lubuntu Guest VM

To allow the communication (SSH protocol) between the Windows Host and the Hyper-V Guest (Lubuntu) Operating System, an internal network must be setup between the Host and the Guest via Hyper-V.

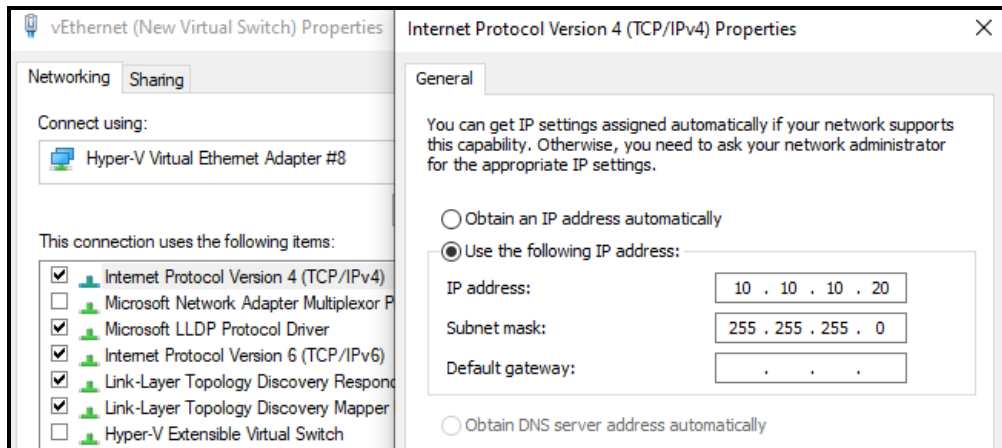

To allow the communication (SSH protocol) the Windows Firewall must be configured to allow python application (anaconda3) for the Guest VM.

The Internal Network for the respective Operating Systems is set to the same subnet:

Lubuntu Guest: inet **10.10.10.10**

```
eth1: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
inet 10.10.10.10 netmask 255.255.255.0 broadcast 10.10.10.255
inet6 fe80::2fc:e8c6:f753:f7a prefixlen 64 scopeid 0x20<link>
ether 00:15:5d:c5:ec:07 txqueuelen 1000 (Ethernet)
RX packets 151623 bytes 6927663 (6.9 MB)
RX errors 0 dropped 0 overruns 0 frame 0
TX packets 96 bytes 10082 (10.0 KB)

```

Windows 10 Hyper-V Network Adapter: IP Address set to **10.10.10.20**

6 Python Implementation of OT IDS Application

There are several components that enable the implementation of IDS application. The important features are as follows:

- SSH Tunneller Module (query the MySQL Database from Remote Computer running the IDS application)
- Ruleset Modules (there are 8 power grid operational technology ‘Use Cases’ discussed in the report, therefore 8 Rules are coded in the IDS application)
- Alert Generation No. 1 – Custom email alert (via a dedicated Gmail account)
- Alert Generation No. 2 – Custom Microsoft Event (can be viewed in the OS Event Viewer. These events could be interrogated by a Security Information Event Management System e.g., Q-Radar SIEM)

SSH Tunneller Module:

The tunneller connects to the localhost via a referred port behind the SSH server i.e., it uses the remote operating systems localhost and MySQL port to connect to the database.

```

import MySQLdb as db
import pandas as pd
import csv

def ssh_import():

    def query(q):
        with SSHTunnelForwarder(
            ('10.10.10.10', 22),
            ssh_username='scada',
            ssh_password='[REDACTED]',
            remote_bind_address=('127.0.0.1', 3306)
        ) as server:
            conn = db.connect(host='127.0.0.1',
                port=server.local_bind_port,
                user='scada',
                passwd='[REDACTED]',
                db='idsanonsyslog')
            return pd.read_sql_query(q, conn)

    # Put teh the SQL Query here to a pandas dataframe df
    select_idsanonsyslog = query('SELECT datetime, event FROM idsanonsyslog.syslogs')

```

The result of the query is then stored into a Python Pandas dataframe, for example 'select_idsanonsyslog'. The SSH Tunneller has been wrapped in function call ssh_import(). In this way it is possible to call the function from the 'main' Python Program.

Refer to stackoverflow site (StackOverFlow, 2021):

Ruleset Modules:

An example code for Rule 8 – Distribution Automation: Layer 2 Authentication 802.1x, is shown below. Here the rule checks the appropriate dataset for 802.1x Supplicant authentication Failures. If the event is present in the database, the result is stored in the Pandas dataframe *keyword_SAS_802.1X_rule_8*

```

import numpy as np
import smtplib, ssl
import win32evtlogutil
import win32evtlog
import sys
import time
from email.mime.text import MIMEText
from email.mime.multipart import MIMEMultipart
from IPython.display import HTML

def ids_rule_8():

    # ----- Beginning of Rule 8: DISTRIBUTION AUTOMATION: Layer 2 Authentication 802.1x -----

    # to handle the embedded quotes in the imported file, we must use quoting=csv.Quote None. This requires import of csv type above. The engine python (instead of C) is more complete.
    SAS_802_1X_rule_8 = pd.read_csv(r'C:\Users\sando\Desktop\python snips\import_idsanonsyslog\python snips\import_idsanonsyslog.csv', quoting=csv.Quote None)
    print(SAS_802_1X_rule_8)
    # (Optional) Further Clean the Data by Deleting the first column which may be superflous. Variations can be used for other columns or rows [startrow:endrow, startcolumn:endcolumn].
    SAS_802_1X_rule_8 = SAS_802_1X_rule_8.iloc[:, 1:]
    # demonstrate the file can be stored to a .txt file with appropriate column names above (i.e. header = 'infer').
    get_csv_file = SAS_802_1X_rule_8.to_csv(r'C:\Users\sando\Desktop\python snips\SASLoginRules\python snips\SASLoginRules.txt', header='infer')
    # Search the DataFrame 'data_selected_1' for values containing a given string (e.g. 'TRIP') and output the associated rows variable 'keyword_dataframe' to another file
    # In the below command the search is conducted via the 'event' column and it searches for 'TRIP' string in that column
    keyword_SAS_802_1X_rule_8 = SAS_802_1X_rule_8[SAS_802_1X_rule_8['event'].str.contains('DISTRIBUTION AUTOMATION: Layer 2 Authentication')]
    print(keyword_SAS_802_1X_rule_8)

    # Demonstrate the file generation with the keyword search
    get_keyword_csv = keyword_SAS_802_1X_rule_8.to_csv(r'C:\Users\sando\Desktop\python snips\SASLoginRules\python snips\SASLoginRules.txt', header='infer')

```

The actual path used for the Operating System that runs the IDS has been blocked out as it is specific to the PC user (sando). The rule has wrapped in a function called **ids_rule_8()** so it can be called by the 'Main' Python Program.

The other 7 rules are coded in a similar manner. The relevant database tables are queried, and the results are stored to Pandas dataframes. These are then checked based on the logic described in the OT IDS application Use Cases.

Alert Generation No. 1 – Custom Email Alerts:

To demonstrate the alerting functionality via email, a test Gmail account was setup to act as the ‘sender email’. The code below accesses the sender Gmail account and provides the extracted data in the form of a HTML format. The information in the alert is converted to HTML format using the method `to_html()`.

`some_result = keyword_SAS_802.1X_rule_8.to_html()`

The example of Rule 8 – Distribution Automation: Layer 2 Authentication 802.1x is provided below. As well as the specific information detected by the IDS with respect to the datasets, the alert also provides more generic information into the subject line to enable the analyst in the SOC to quickly determine the nature of the alert i.e. ‘An OT System Alert’.

The email alerting code is also contained within the respective rule module i.e., for Rule 8 the code is wrapped in the Rule 8 function **`ids_rule_8()`**.

```
----- Send an the Alert Email
some_result = keyword_SAS_802.1X_rule_8.to_html()
print(some_result)

sender_email = "2021@gmail.com"
receiver_email = "2021@gmail.com"
password = " "

message = MIMEMultipart("alternative")
message["Subject"] = "OT System Alert"
message["From"] = sender_email
message["To"] = receiver_email

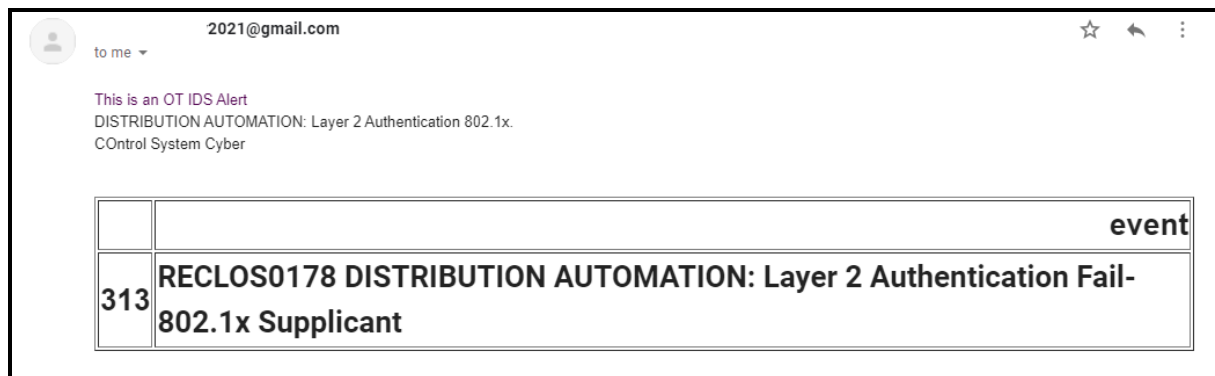

# Create the plain-text and HTML version of your message
text = """
This is an OT IDS Alert
DISTRIBUTION AUTOMATION: Layer 2 Authentication 802.1x
"""

# Print out the alerted variable from the IDS in HTML i.e. {some_result}
html = """
<html>
  <body>
    <p>This is an OT IDS Alert<br>
      DISTRIBUTION AUTOMATION: Layer 2 Authentication 802.1x.<br>
      CONTROL System Cyber<br>
    <br><h1>{some_result}</h1><br>
  </p>
</body>
</html>
""".format(some_result=some_result)

# Turn these into plain/html MIMEText objects
part1 = MIMEText(text, "plain")
print(part1)
part2 = MIMEText(html, "html")
# Add HTML/plain-text parts to MIMEMultipart message
# The email client will try to render the last part first
message.attach(part1)
message.attach(part2)

# Create secure connection with server and send email
context = ssl.create_default_context()
with smtplib.SMTP_SSL("smtp.gmail.com", 465, context=context) as server:
    server.login(sender_email, password)
    server.sendmail(
        sender_email, receiver_email, message.as_string()
    )
```

Refer to (StackOverFlow, 2021b). The resulting email alert for a positive detection of Rule 8 can be seen below.

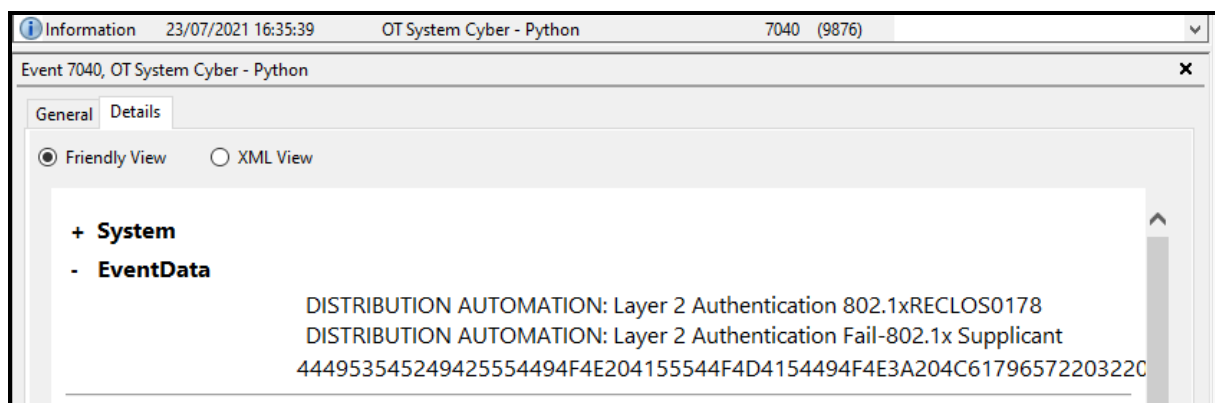

Alert Generation No. 2 – Custom MS Event:

To demonstrate the alerting functionality via the MS Event generation the code below takes the data that has been positively detected by the Pandas dataframe search and populates it into the appropriate format used by the system event logs.

```
# Put in the MS Event log code here for rule 8.
App_Name = "OT System Cyber - Python"
App_Event_ID = 7040
App_Event_Category = 9876
App_Event_Type = win32evtlog.EVENTLOG_WARNING_TYPE
App_Event_Str = ["DISTRIBUTION AUTOMATION: Layer 2 Authentication 802.1x{}".format(var) for var in keyword_SAS_802_1X_rule_8['event']]
App_Event_Data = "DISTRIBUTION AUTOMATION: Layer 2 Authentication 802.1x"
...
win32evtlogutil.ReportEvent(ApplicationName, EventID, EventCategory, EventType, Inserts, Data, SID)
...
win32evtlogutil.ReportEvent(App_Name, App_Event_ID, eventCategory= App_Event_Category, eventType=win32evtlog.EVENTLOG_INFORMATION_TYPE, strings=App_Event_Str, data=App_Event_Data)
```

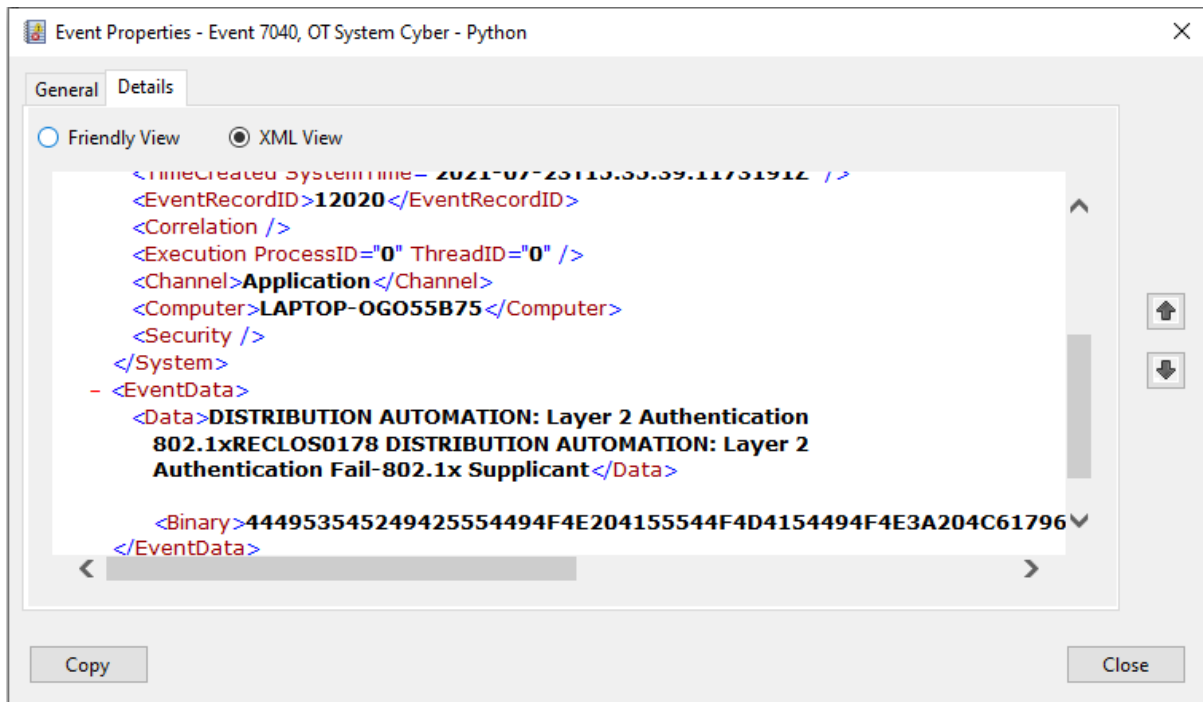

The above code is provided from the example Rule 8 function. Like the email alert, the above code is wrapped within the overall rule function i.e., Rule 8 function **ids_rule_8()**. When the rule 8 module is called by the main program it executes the email alert and system log event each time it is called. An example of the system log event generated from a positive detection of rule 8 is show below.

Refer to (StackOverFlow, 2021).

Other Data view is also available from the event viewer to show the detected alert information can be put into the XML format that can be read by other systems.

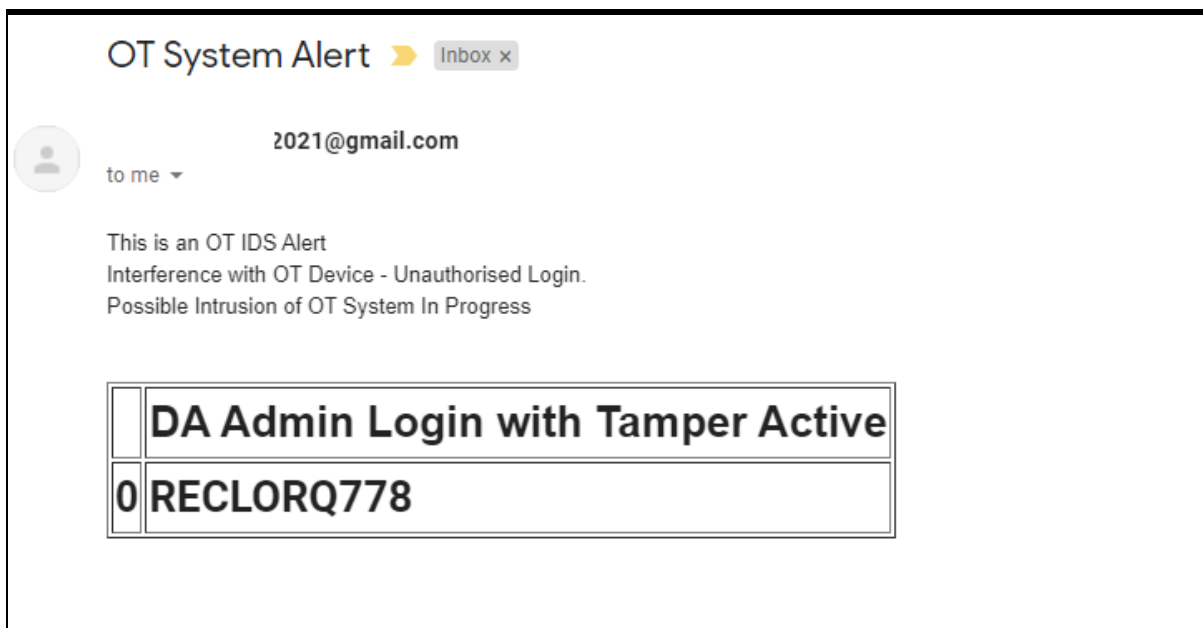

Note that the system log is also timestamped by the Host System i.e. event logged on **23/07/2021 at 16:35:39**.

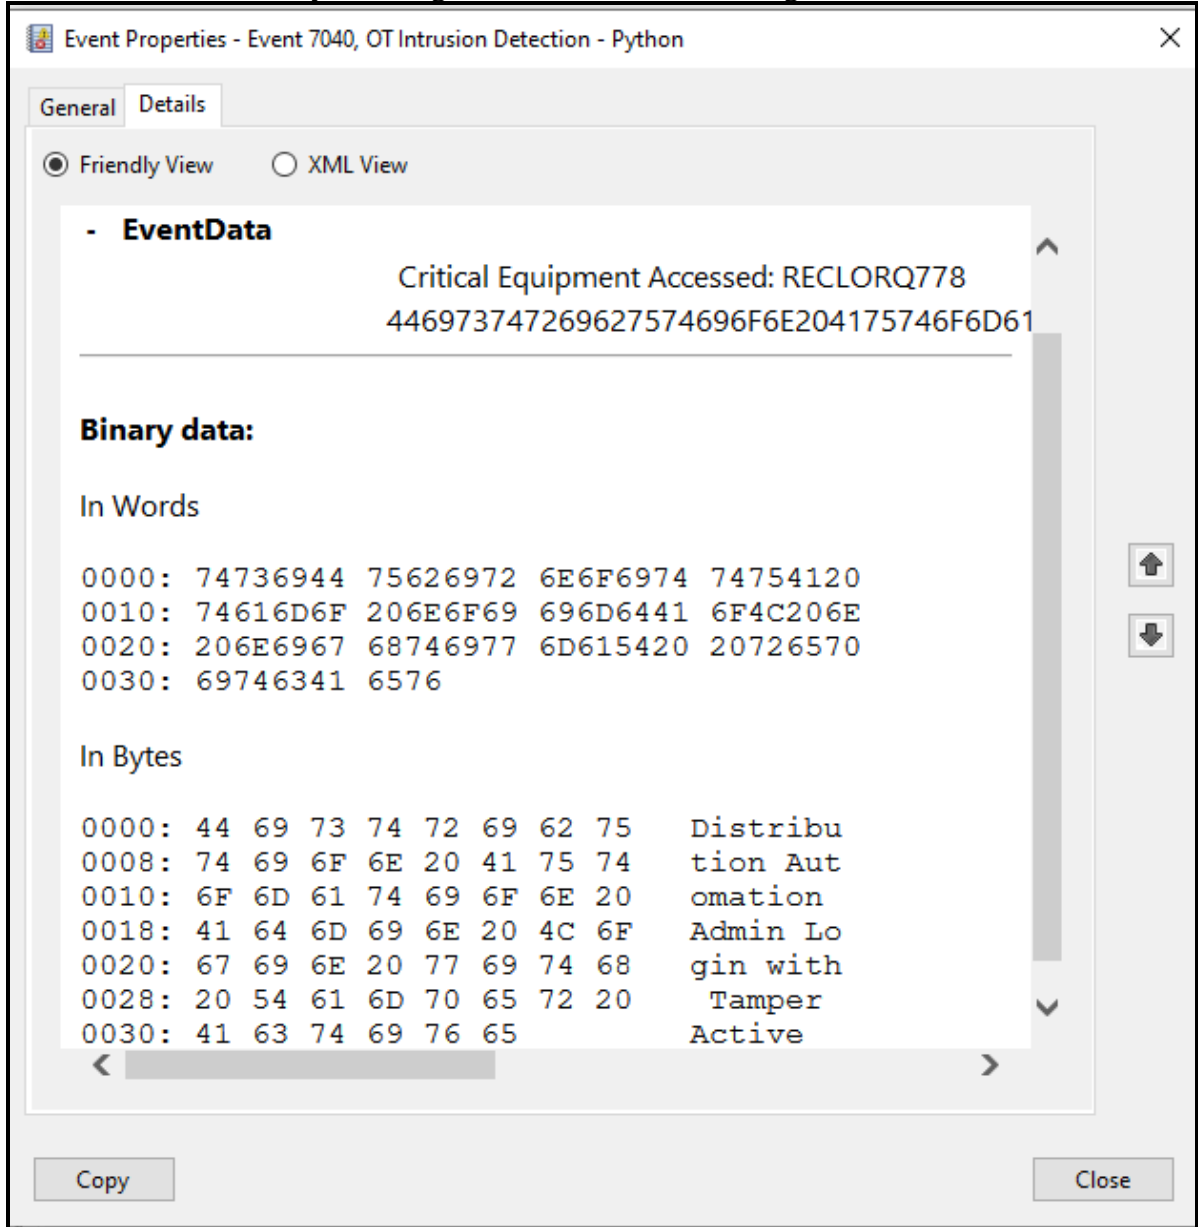

Summary of OT IDS Alerting for remaining Rules 1 to 7:

Rule No 1. Call's function `ids_rule_1()` in Main Program.

Rule No 1 - Email Alert: The Device RECLORQ778 is Subject to Possible Tampering.

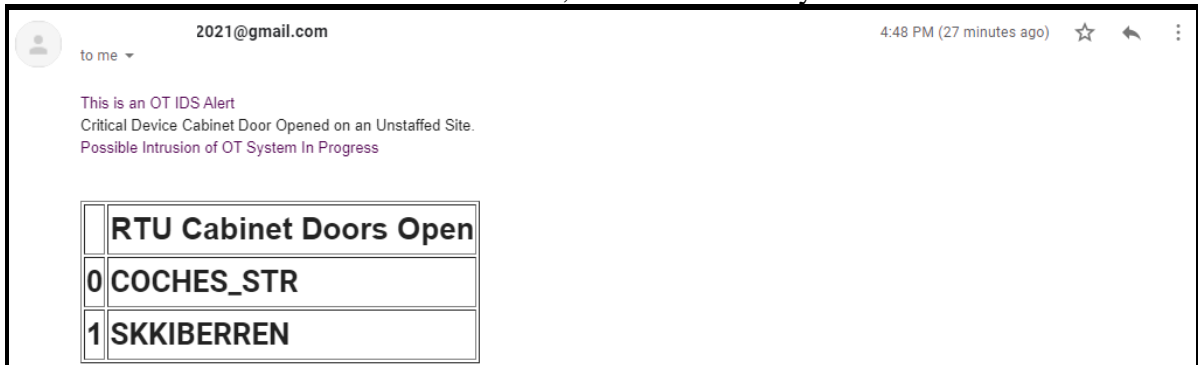

Rule No 1 - Microsoft System Log: Detects Unauthorised Login to Distribution Automation.

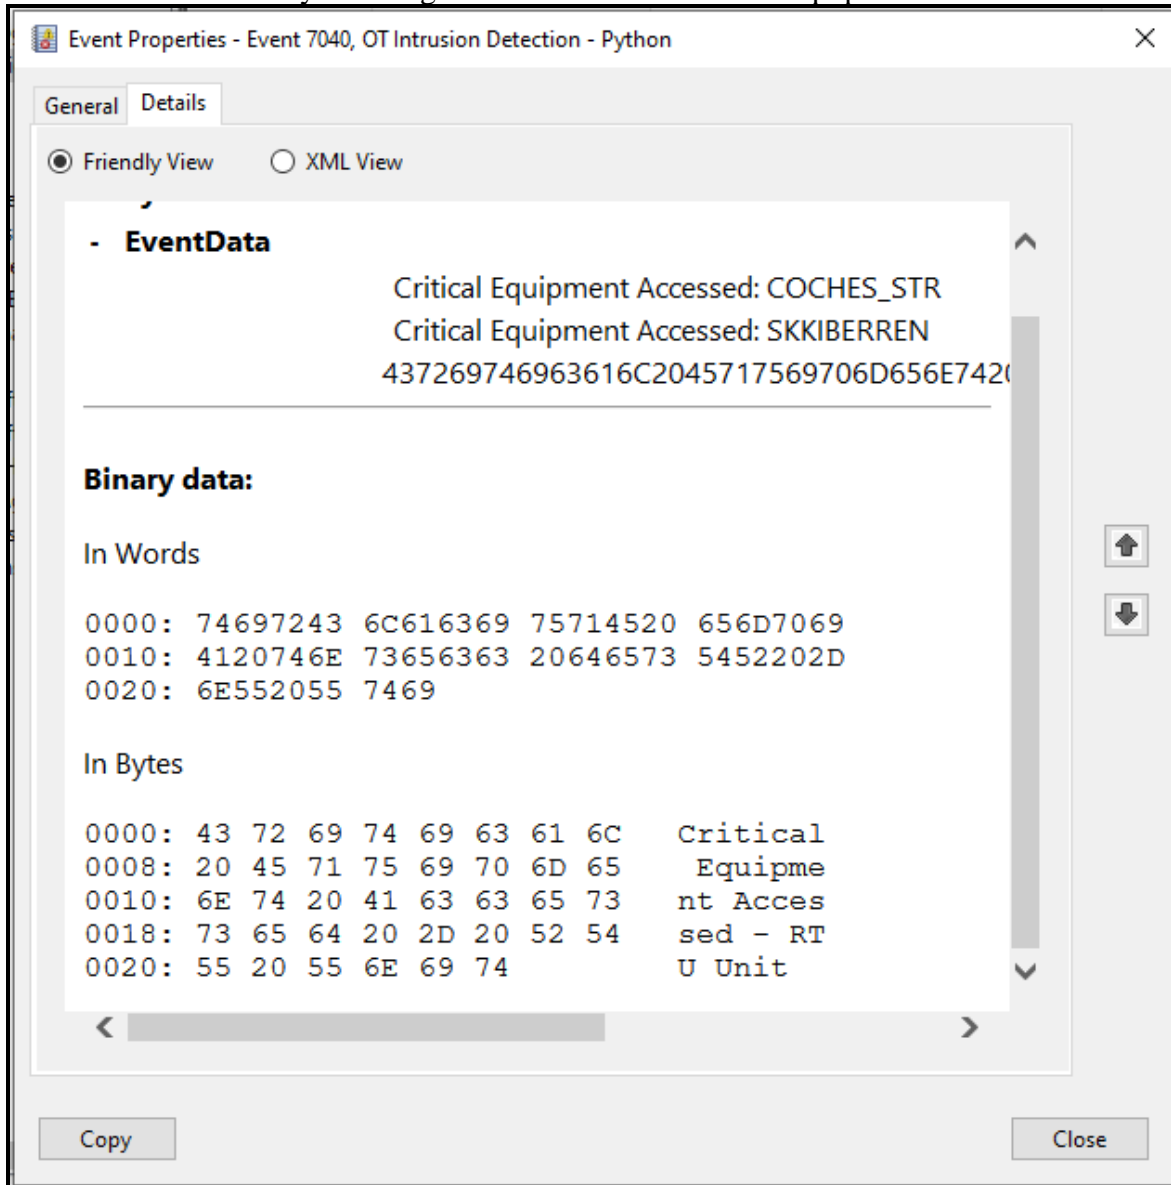

Rule No 2. Call's function ids_rule_2() in Main Program.

Rule No 2 - Email Alert: Unauthorised Access to Critical Equipment in Coches_Str and Skkiberren Substations. No Staff are on site, so access is not by authorised.

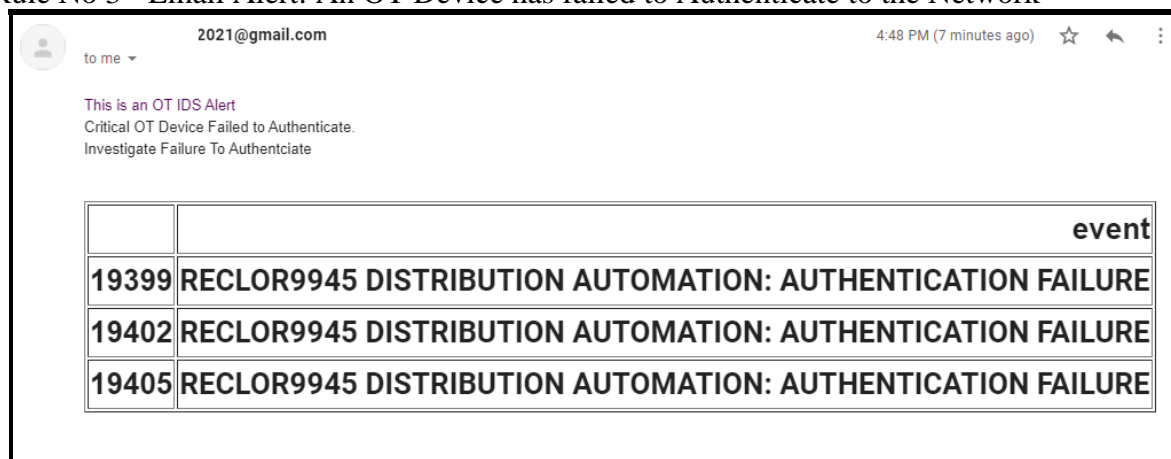

Rule No 2 - Microsoft System Log: Detects access to Critical Equipment in 2 Substations.

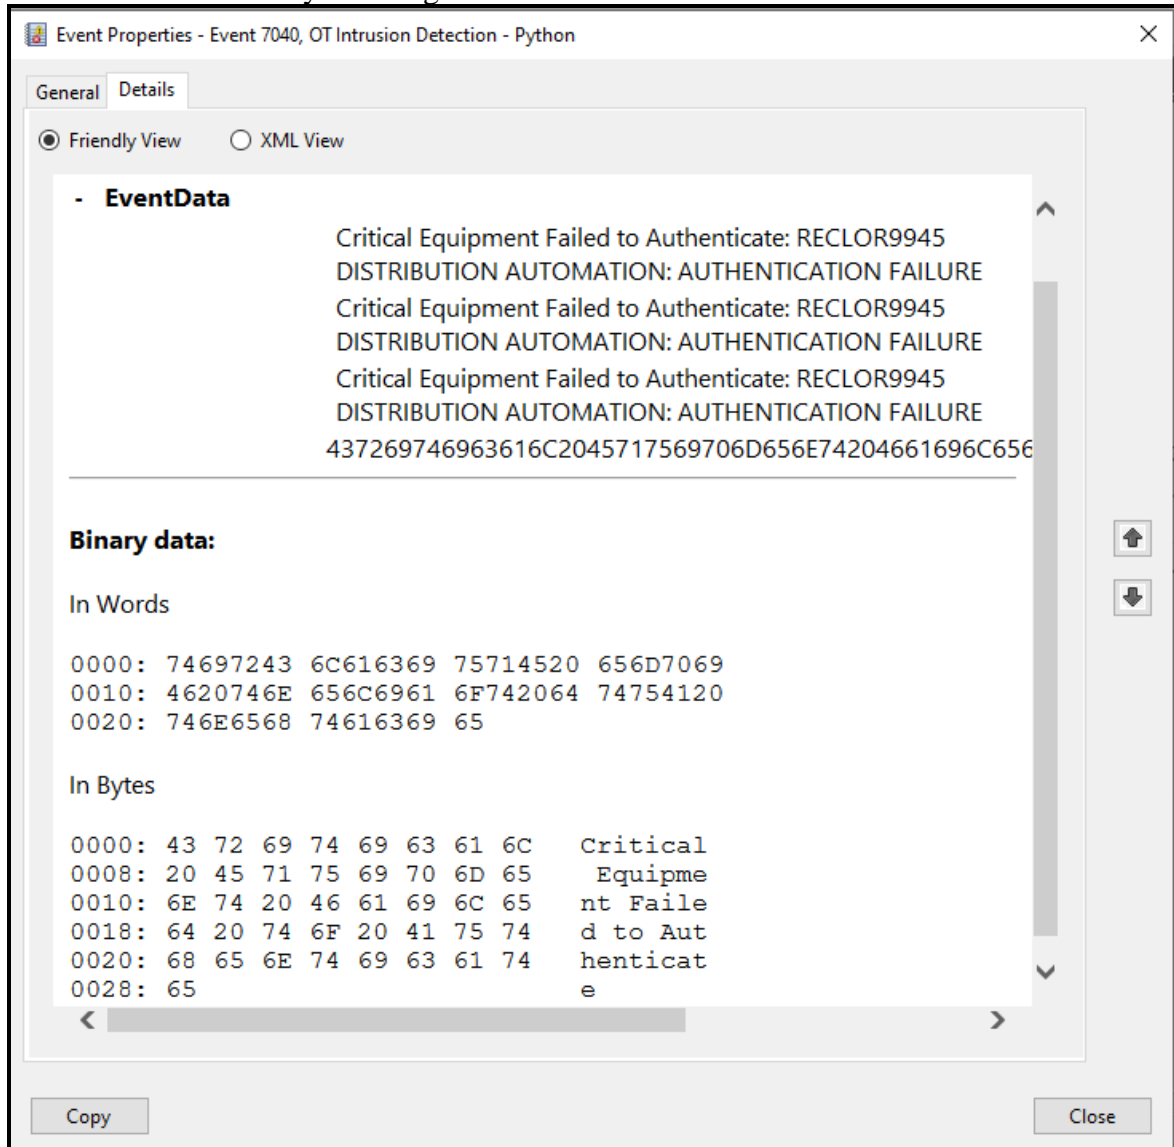

Rule No 3. Call's function ids_rule_3() in Main Program.

Rule No 3 - Email Alert: An OT Device has failed to Authenticate to the Network

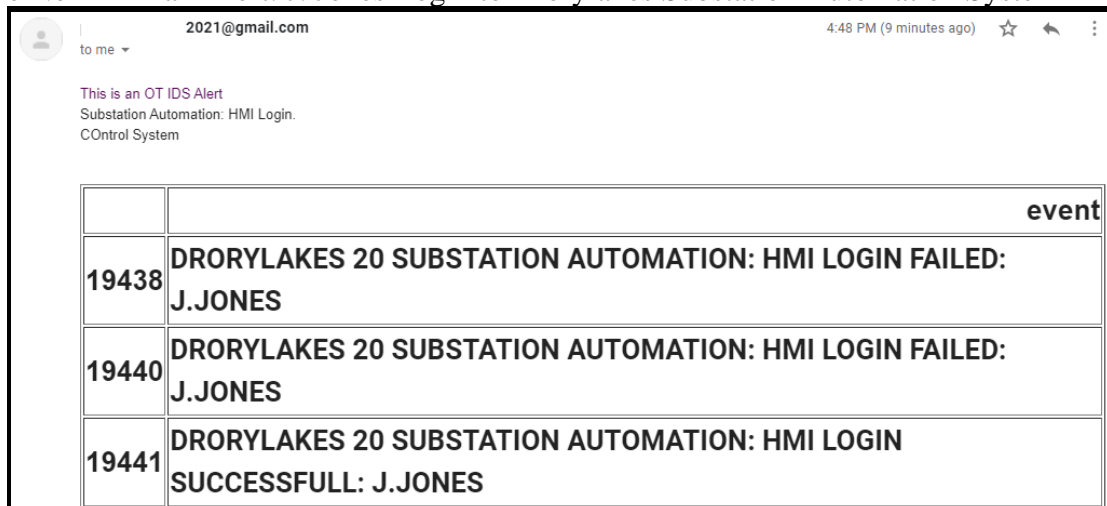

Rule No 3 - Microsoft System Log: Authentication Failure from OT Device

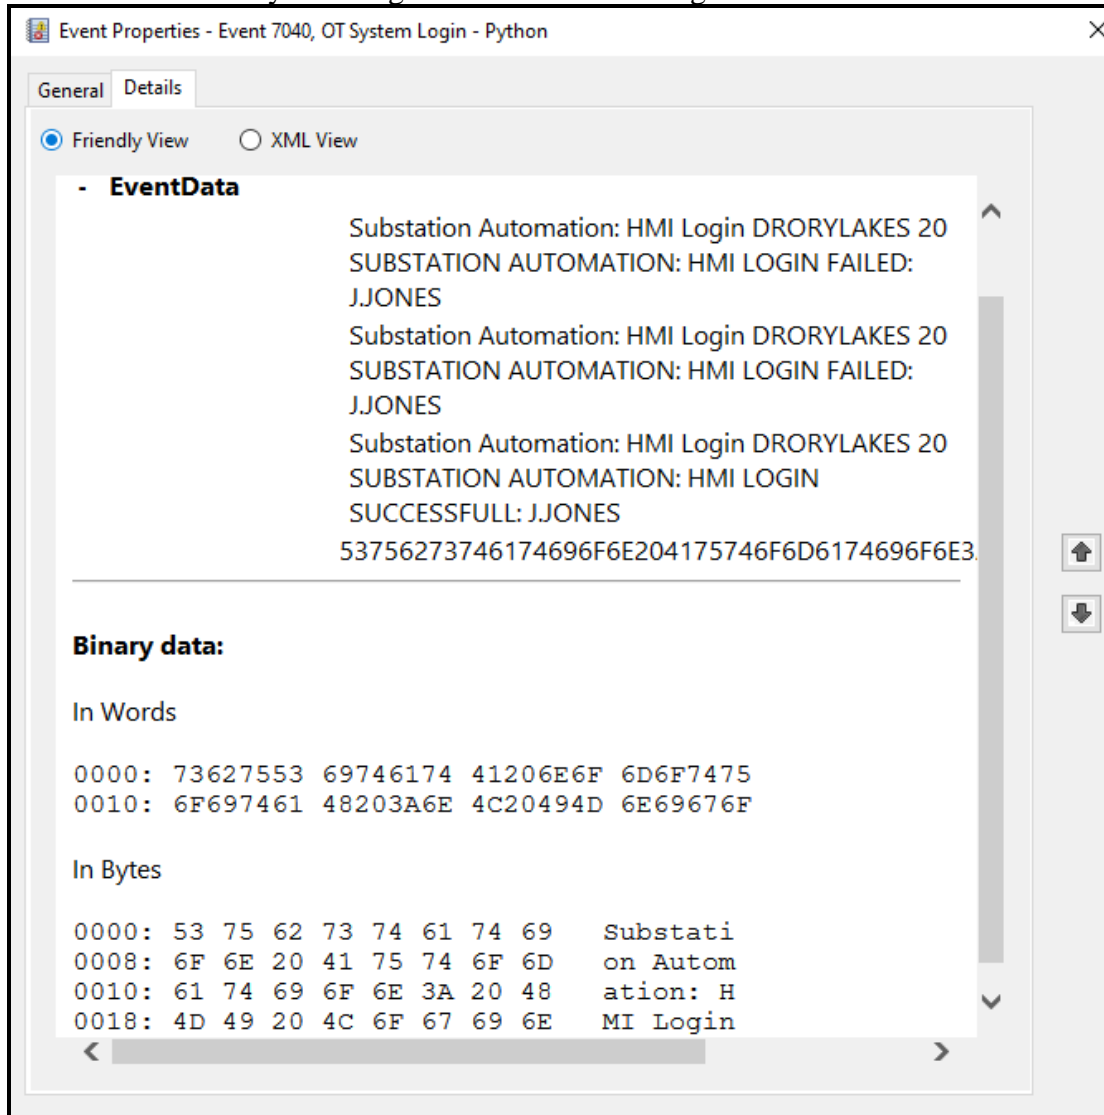

Rule No 4. Call's function ids_rule_4() in Main Program.

Rule No 4 - Email Alert: J. Jones Login to Drorylakes Substation Automation System

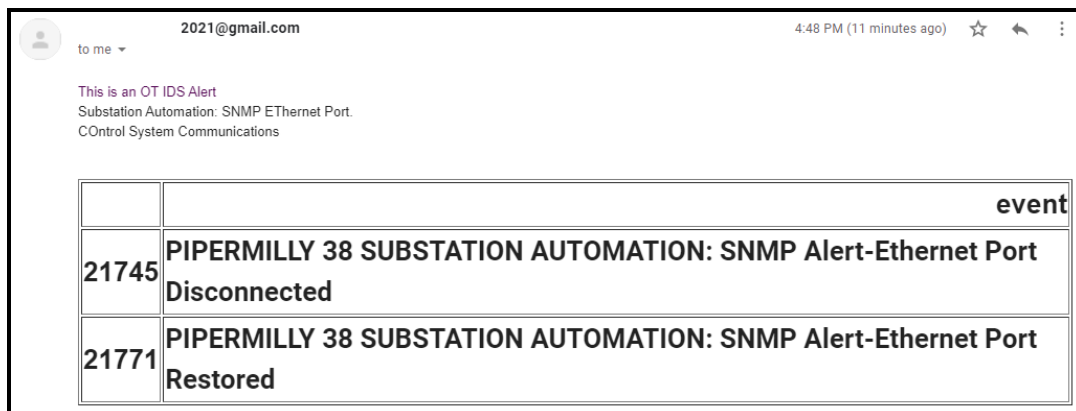

Rule No 4 - Microsoft System Log: Successful/Failed Login to Substation Automation

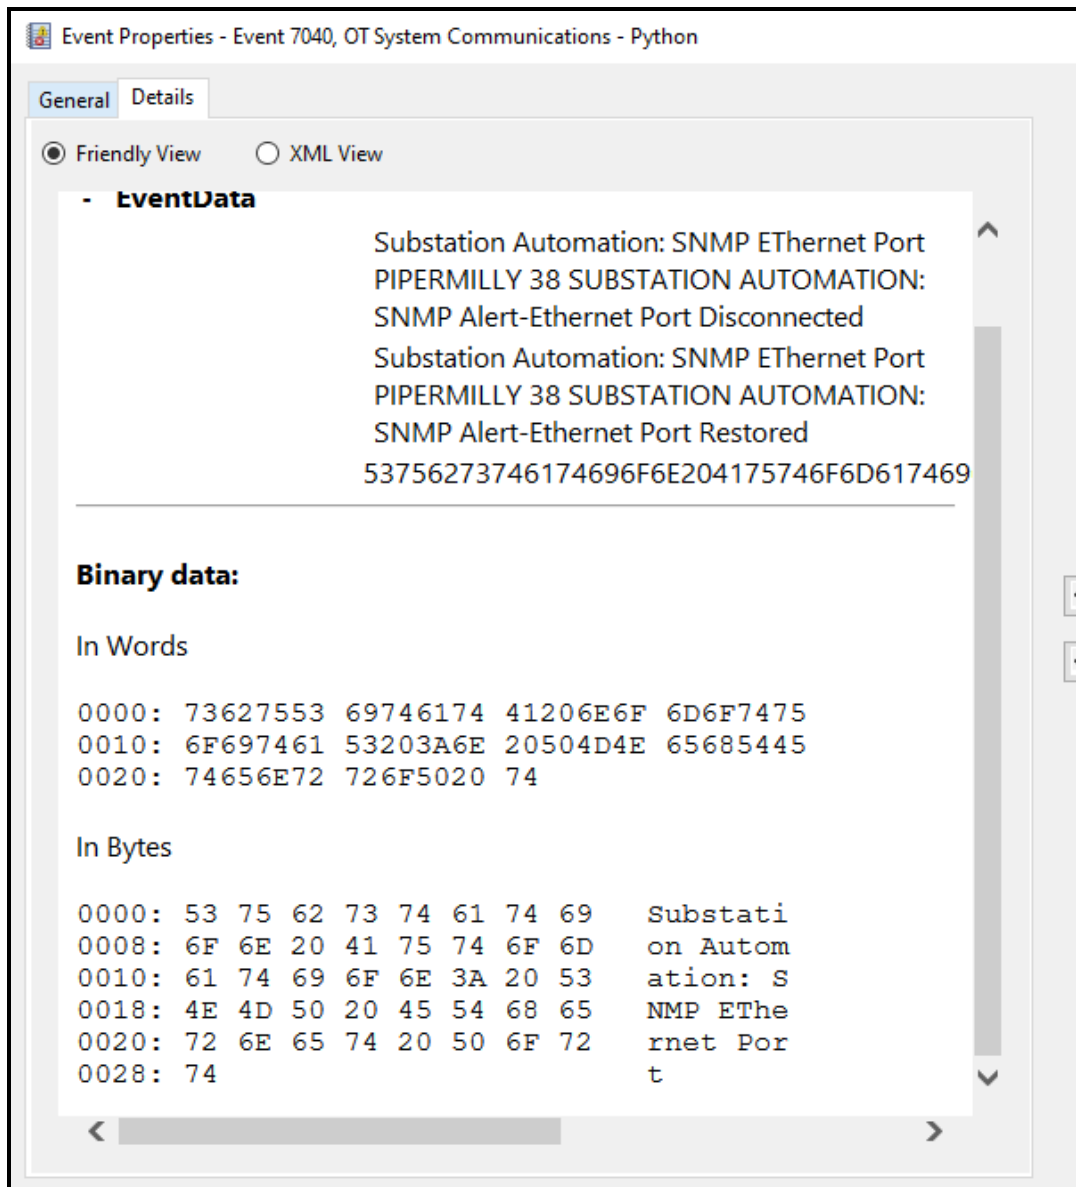

Rule No 5. Call's function ids_rule_5() in Main Program.

Rule No 5 - Email Alert: Pipermilly Substation Automation Port Disconnection Detected

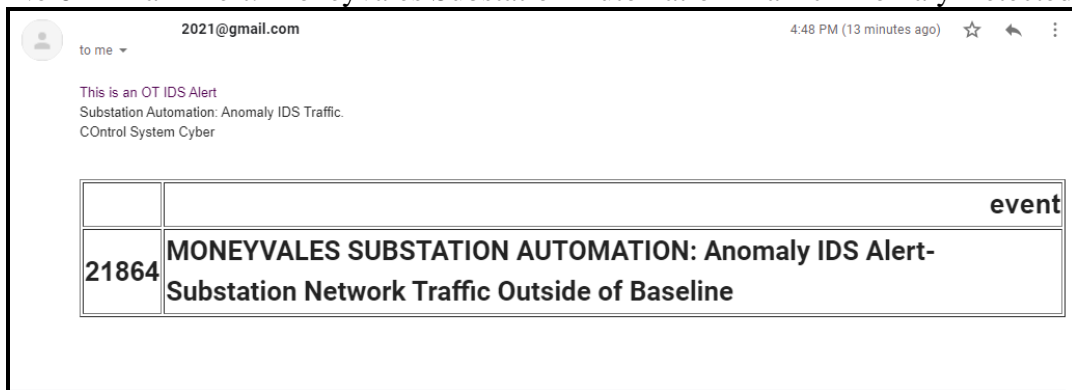

Rule No 5 - Microsoft System Log: SNMP Port Failure Detection in OT Network

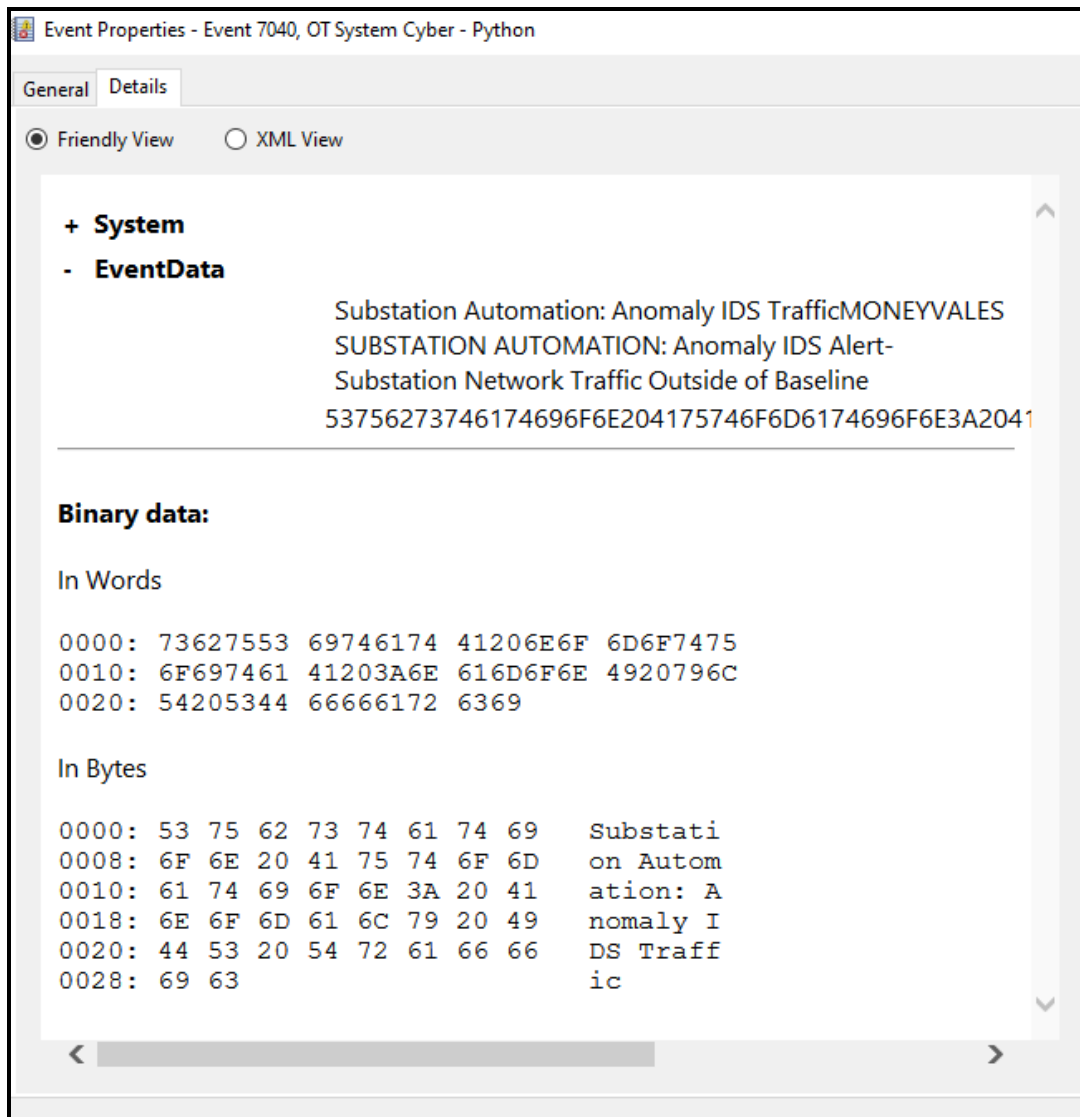

Rule No 6. Call's function ids_rule_6() in Main Program.

Rule No 6 - Email Alert: Moneyvales Substation Automation Traffic Anomaly Detected.

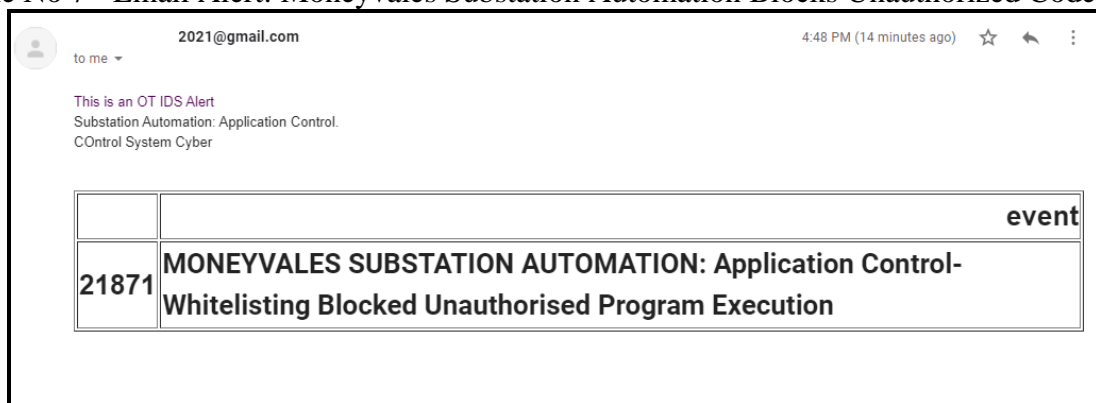

Rule No 6 - Microsoft System Log: OT Anomaly Based IDS Traffic Abnormal.

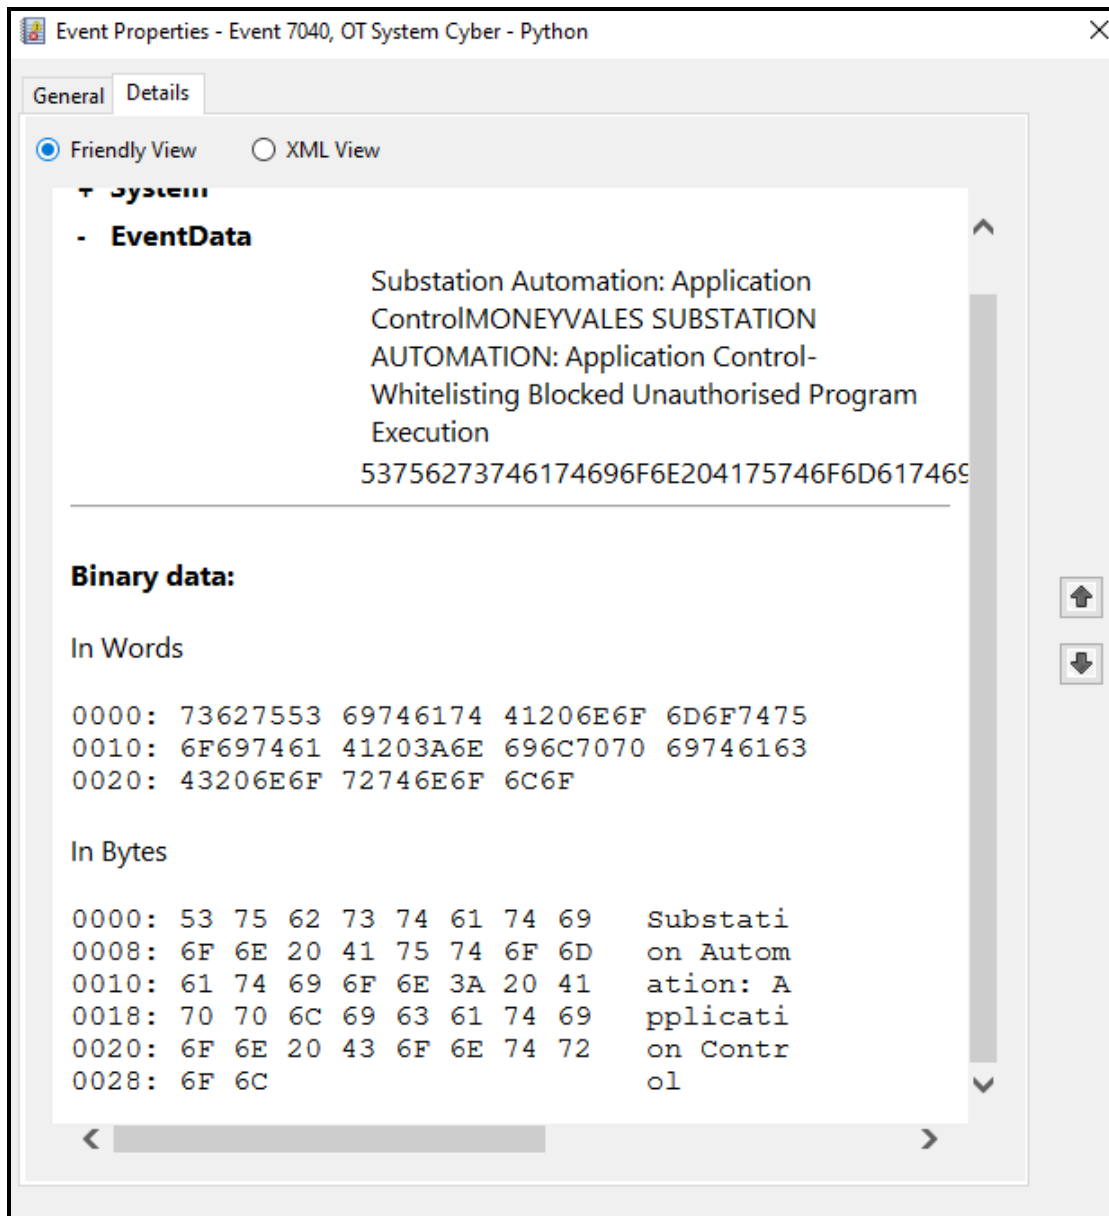

Rule No 7. Call's function ids_rule_7() in Main Program.

Rule No 7 - Email Alert: Moneyvales Substation Automation Blocks Unauthorized Code.

Rule No 7 - Microsoft System Log: Substation Automation System Application Control.

7 Running Program – ‘IDS Program Main’

The OT IDS application has been designed in a modular fashion. A main program calls the relevant program modules in a recursive manner. The Main Python Program is shown below.

```

import IDS_Program_Rule_1
import IDS_Program_Rule_2
import IDS_Program_Rule_3
import IDS_Program_Rule_4
import IDS_Program_Rule_5
import IDS_Program_Rule_6
import IDS_Program_Rule_7
import IDS_Program_Rule_8
import ssh_tunneller_ver_2
import IDS_Program_Clean_Up
import time

while True:

    ssh_tunneller_ver_2.ssh_import()
    time.sleep(5)
    IDS_Program_Rule_1.ids_rule_1()
    time.sleep(5)
    IDS_Program_Rule_2.ids_rule_2()
    time.sleep(5)
    IDS_Program_Rule_3.ids_rule_3()
    time.sleep(5)
    IDS_Program_Rule_4.ids_rule_4()
    time.sleep(5)
    IDS_Program_Rule_5.ids_rule_5()
    time.sleep(5)
    IDS_Program_Rule_6.ids_rule_6()
    time.sleep(5)
    IDS_Program_Rule_7.ids_rule_7()
    time.sleep(5)
    IDS_Program_Rule_8.ids_rule_8()
    time.sleep(5)
    IDS_Program_Clean_Up.ids_cleanup()
    time.sleep(5)

```

The ‘while True:’ function ensures the program runs continuously. It continuously selects OT database tables information and parses them against the 8 rules. At the beginning of each loop the data is acquired by the SSH Tunneller module and stored to a location where each rule is applied. For demonstration purposes each module is delayed by 5 seconds. The final module performs a tidy up of the data that has been generated by the preceding loop to ensure each loop executes from clean file data and no variables reside in memory from a previous loop execution.
