### **MSc Project Submission Sheet**

### **School of Computing**

Student Name:	Eldhose Shaji		
Student ID:	X21195986		
Programme:	MSc Cybersecurity	Year:	2023
Module:	MSc Research Project		
Supervisor:	Noel Cosgrave		
Submission Due Date:	14/08/2023		
Project Title:	Resource Isolation to Mitigate Denia Computing	al-of-Service	e and DDoS Attacks in Cloud
Word Count:	1608	Page Cour	nt:13

I hereby certify that the information contained in this (my submission) is information pertaining to research I conducted for this project. All information other than my own contribution will be fully referenced and listed in the relevant bibliography section at the rear of the project. <u>ALL</u> internet material must be referenced in the bibliography section. Students are required to use the Referencing Standard specified in the report template. To use other author's written or electronic work is illegal (plagiarism) and may result in disciplinary action.

## PLEASE READ THE FOLLOWING INSTRUCTIONS AND CHECKLIST

Attach a completed copy of this sheet to each project (including multiple copies)	
Attach a Moodle submission receipt of the online project submission, to each project (including multiple copies).	
You must ensure that you retain a HARD COPY of the project, both for your own reference and in case a project is lost or mislaid. It is not sufficient to keep a copy on computer.	

Assignments that are submitted to the Programme Coordinator Office must be placed into the assignment box located outside the office.

Office Use Only							
Signature:							
Date:							
Penalty Applied (if applicable):							

## **Configuration Manual**

## Eldhose Shaji Student ID: x21195986

## **1** Introduction

The configuration manual is the list of specific configurations that were done in the host system as well as in the lab environment of the research project. The document also entails the details of the software tools used in the research and also the hardware requirements along with the configurations of it. The aim of the project is to properly secure the cloud resources by isolating them and thereby mitigate the DoS/DDoS attacks. The proper isolation can be helpful in not only mitigating the DDoS/DoS attacks but also helping to eliminate the chances of occurrence of co-process interference between tenants in the multi-cloud environment. The lab of the project is designed to match the exact real-time cloud environment but in the simulated and controlled environment. Thus, it will be helpful in assessing the robustness of the proposed method and to evaluate its efficiency.

## 2 Hardware Requirements

The lab environment is configured in the local laptop and the configurations of the same are listed in the table below.

Operating System	Windows 11 Home Edition					
OS Version and Build	22H2, 22621.1992					
Processor	11th Gen Intel(R) Core (TM) i7-1165G7 @ 2.80GHz 2.70 GHz					
Storage	512 GB PCIe® NVMe™ M.2 SSD					
RAM	16.0 GB (15.7 GB usable)					
System Type	64-bit operating system, x64-based processor					
System Make and Model	HP-Pavilion Series					

## **3** Software Requirements and Configurations

Below is the list of software tools and their specifications used in the lab testing and evaluation of the proposed methodology for resource isolation.

## i. Wireshark

## Version: Version 4.0.0 (v4.0.0-0-g0cbe09cd796b).

Wireshark is a free and open-source packet analyser used for network troubleshooting, analysis, software development, and communications protocol research. Wireshark is used in this project to track packets and filter them by specific rules. In this project, Wireshark has been employed to monitor the entire packets during the event of an attack and also at the normal functioning of the system. Also, Wireshark has been employed to find out the packets that are really causing the DDoS/DoS attacks. The configurations enabled in Wireshark and the screen snip of the related data are shown below.

## ii. Kali Linux

## Version: Kali-Linux-2022.4-vmware-amd64.

Kali is a popular OS distribution from Linux, which allows us to conduct Pentesting, ethical hacking, digital forensics and much more. Kali Linux is employed as the attacking virtual machine in this project and it is used to flood the targeted VM to multiple TCP requests in a limited time period. To launch the attack and to generate a huge volume of data traffic or requests to the target VM, the 'Hping3' command is being used. The **'hping3 -S -p <port> -- flood <target\_ip>**' command sends a flood of TCP SYN packets to the target IP and port, simulating a Denial of Service (DoS) attack. The screen snips of the configurations done in Kali Linux are as shown below.

Figure 10. Kali VM IP configurations

<pre>[root@ kali)-[/home/kali]</pre>				
<b>u</b> ping 192.168.87.136

Figure 11 Kali VM ping to Victim (Ubuntu VM)

## iii. Ubuntu

### Version: kali-linux-2023.1-VirtualBox-amd64

Ubuntu is also a popular Linux distribution that is being used in most servers, because of its user-friendly GUI and security offered by the Linux platform. Ubuntu is picked because of most the servers running in the cloud are using Ubuntu OS and using the same OS in the simulation will make the lab setup more connected to the real-world infrastructure. Thereby evaluation of the proposed methodology can be more impactful.

The configurations made in the Ubuntu VM are depicted by the following screen snips.

Figure 13. Ubuntu VM IP configuration

## iv. VMware

#### Version: VMware-workstation-17.0.0-20800274

VMware is the virtualisation software tool used for hosting the attacking Kali VM and the victim Ubuntu VM. It allows running multiple VMs on the same local system seamlessly and offers more customisable settings to be done at any of the installed VM packages. The above-stated are the main reasons for selecting VMware as the virtualisation tool. The screen snip of the same is as shown below.

## 4 Dataset & System Load

The dataset used in the project is the primary data that has been obtained as a result of the implementation. The primary data used in the project is the IP packets found as the attacking packet and those were not the attacking packets out of the whole packets sent. The system utilisation during the event of a DDoS attack can be found by analysing the resource utilisation graph of the local system. The system will be working under stress conditions when a DDoS or DoS attack hits and due to the enormous system utilisation, the whole system gets collapsed. The image of the same is attached below.

Figure 15. System Utilisation

Packet Number	Source IP	Destination IP	Protocol	Length	Description
1	192.168.87.135	192.168.87.136	ТСР	120	SYN packet (Attack)
2	192.168.87.135	192.168.87.136	ТСР	120	SYN packet (Attack)
1123	192.168.87.135	192.168.87.136	ТСР	1500	Normal Data Packet
1124	192.168.87.135	192.168.87.136	ТСР	1500	Normal Data Packet
15000	192.168.87.135	192.168.87.136	ТСР	120	SYN packet (Attack)

Table 1 Packets identified to be successful in DDoS attack

## 5 Mitigation.

The proposed mitigation technique using the iptables are shown below. Below are the detailed screenshots of the configurations made in the Ubuntu VM for making the entries in the iptable.

```
ubuntu@ubuntu2004:-$ iptables -N thyl-syn-flood
Fatal: can't open lock file /run/xtables.lock: Permission denied
ubuntu@ubuntu2004:-$ sudo iptables -N thyl-syn-flood
ubuntu@ubuntu2004:-$ sudo iptables -A INPUT -p tcp --syn -j thyl-syn-flood
ubuntu@ubuntu2004:-$ sudo iptables thyl-syn-flood -m limit --limit 2/s --limit-t
urst 6 -m
Bad argument `thyl-syn-flood'
Try `iptables -h' or 'iptables --help' for more information.
ubuntu@ubuntu2004:-$ sudo iptables -A thyl-syn-flood -m limit --limit 2/s --limit
t-burst 6 -m
iptables v1.8.4 (legacy): option "-m" requires an argument
Try `iptables -h' or 'iptables --help' for more information.
ubuntu@ubuntu2004:-$ sudo iptables -A thyl-syn-flood -m limit --limit 2/s --limi
t-burst 6
ubuntu@ubuntu2004:-$ sudo iptables -A thyl-syn-flood -m limit --limit 2/s --limi
t-burst 6
ubuntu@ubuntu2004:-$ sudo iptables -A thyl-syn-flood -m limit --limit 2/s --limi
t-burst 6
```

Figure 19 Involving the Nsa script for Rsa Token isolation.

The above figure represents the overall RSA token isolation process. By applying the NSA script, the isolation of the RSA Token is completed.

## **6** Evaluation

The project evaluation can be done by the formulation of a confusion matrix and the same can be executed in the Jupiter notebook to get the precision, accuracy, misclassification rate and prevalence. Jupiter notebook has been used for the calculation of the same and below are the code snippets and the related outputs.

Below shown is the confusion matrix tabulated for evaluating the accuracy and precision of the DDoS attack mitigation solution. The table consists of the data like true negative, false positive, false negative and true positive. In this case of the project, the vectors are the IP packets detected as the cause of the DDoS attack and those were not. Fifteen thousand IP packets were used in the simulation and the confusion matrix was made out of the observed data. The details of the attacking packets are mentioned in the main report in a tabular format.

Below is the confusion matrix of the dataset.

n = 15000	Packets failed to Attack	Packets succeeded in Attack	
Packets failed to Attack	TN =2202	FP =1798	4000
Packets succeeded in Attack	FN =478	TP =10522	11000
	2680	12320	

## **Table 1 Confusion Matrix**

The flowing are the codes executed in the Jupiter notebook, for generating the confusion matrix so as to evaluate the accuracy and precision of the proposed solution. The code snippets along with the obtained output are attached as follows.

## **Figure 20 Importing Libraries**

*Numpy* is the mathematical library used in Python (Jupiter Notebook) for scientific calculations. *Matplotlib.pyplot* is the Python library that is used for making the different types of plots that are required in the evaluation of the project. Here this library is used for generating the confusion matrix and to derive the conclusion from it.
