Student Name:	Venkateshwarlu vanga
Student ID:	x22158952
Programme:	MSc in Cloud Computing
Year:	2023
Module:	MSc Research Project
Supervisor:	Shaguna Gupta
Submission Due Date:	14/12/2023
Project Title:	Configuration Manual
Word Count:	1320
Page Count:	14

I hereby certify that the information contained in this (my submission) is information pertaining to research I conducted for this project. All information other than my own contribution will be fully referenced and listed in the relevant bibliography section at the rear of the project.

ALL internet material must be referenced in the bibliography section. Students are required to use the Referencing Standard specified in the report template. To use other author's written or electronic work is illegal (plagiarism) and may result in disciplinary action.

Signature:	Venkateshwarlu Vanga
Date:	14th December 2023

PLEASE READ THE FOLLOWING INSTRUCTIONS AND CHECKLIST:

Attach a completed copy of this sheet to each project (including multiple copies).	<input type="checkbox"/>
Attach a Moodle submission receipt of the online project submission , to each project (including multiple copies).	<input type="checkbox"/>
You must ensure that you retain a HARD COPY of the project , both for your own reference and in case a project is lost or mislaid. It is not sufficient to keep a copy on computer.	<input type="checkbox"/>

Assignments that are submitted to the Programme Coordinator office must be placed into the assignment box located outside the office.

Office Use Only

Configuration Manual

Venkateshwarlu vanga
x22158952

1 Introduction

This document aims to provide a detailed guide for setting up and managing the project efficiently. It covers system architecture, installation steps, configuration choices, execution process, and analysing the results. It also provides an overview of the research project's development for "Securing Cloud Environments Through Real-Time Network Monitoring System for Detecting Network Attacks using Advanced Deep Learning Methods" It's crucial to review this document thoroughly before deploying the project.

2 Prerequisites

This document is for people who are familiar with Ubuntu, Python, basic Deep Learning concepts, and Python Flask. Knowing these things will help you understand and use the information in this document more effectively.

3 Environment Setup

For setting up the environment, I utilized Anaconda for running Jupyter notebook, the same can see at Figure 1.

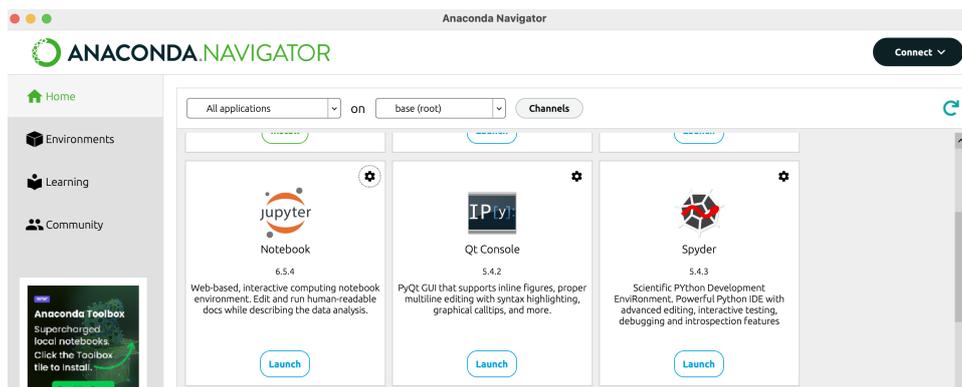

Figure 1: Anaconda Navigator

All necessary libraries, such as Pandas and Numpy, were installed. These libraries played a crucial role in reading, mapping, and visualizing the dataset. Additionally, the

Sklearn library (Scikit-learn) was employed for data analysis and modeling, offering various algorithms for classification. To develop deep learning models, I utilized Tensorflow and Keras. Figure 2.

```

In [46]: port numpy as np           # importing numpy for numerical, array manipulation
port pandas as pd                 # importing pandas for data manipulation
port sys                           # importing sys library

```

Figure 2: Libraries List

For implementation, AWS Cloud was used, and an EC2 Instance with the latest version of Ubuntu was configured Figure 3. The project primarily leverages the Python programming language, and we ensured the use of the latest version, which can be verified and downloaded from <https://www.python.org/downloads/>.

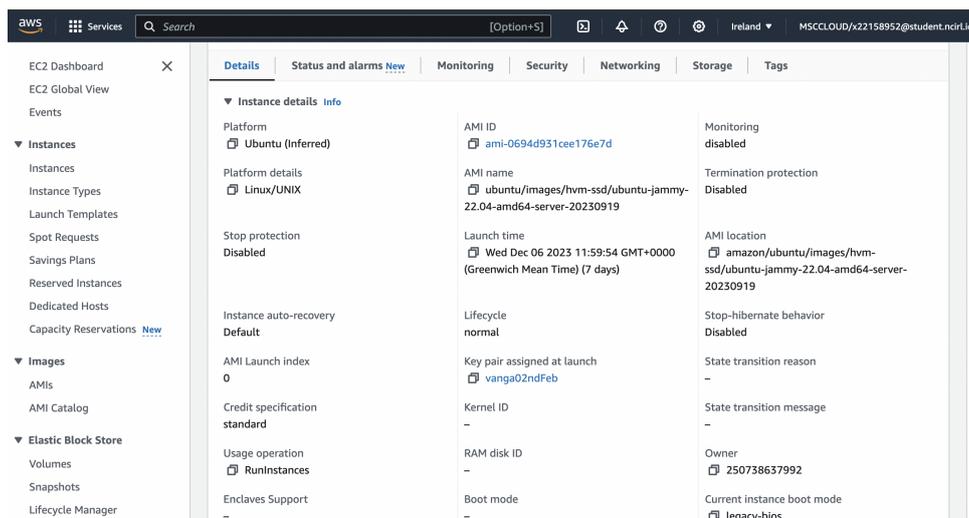

Figure 3: AWS EC2 instance

Multiple libraries, including TensorFlow, Matplotlib, and Scikit-learn, were incorporated into the project using the pip command as shown below. Along with Python Flask.

Figure 7: Installing Python Flask

4 Implementation

Our project model contains different components, which can be seen below.

4.1 Dataset collect

The UNSW-NB15 dataset was created by the University of New South Wales for use in the 2015 International Knowledge Discovery and Data Mining Tools Competition. Like the older KDD Cup 1999 dataset, the UNSW-NB15 dataset is intended to help develop effective network intrusion detection systems. The goal of the dataset is to enable the creation of models that can accurately differentiate between malicious and benign network traffic. A key strength of the UNSW-NB15 dataset is that it contains a wide variety of simulated attack types within a modeled university network environment. The audit-friendly data provides rich details on diverse intrusion scenarios. Overall, the UNSW-NB15 dataset represents a valuable research resource to drive continued progress on cybersecurity data analysis and predictive modeling for intrusion detection.

4.2 Data Preprocessing

In this stage first we are looking at the raw data from dataset. To accommodate the large dataset, we divided it into four separate CSV files named UNSW-NB15-1.csv, UNSW-NB15-2.csv, UNSW-NB15-3.csv, and UNSW-NB15-4.csv. These files are defined as df1, df2, df3, and df4, as shown in the Figure 8.

```
Reading Raw Data

Since this dataset is very large therefore chunked into 4 different csv files, Reading each file separately

In [47]: features = pd.read_csv('UNSW-NB15_features.csv', sep=",", encoding='cp1252') # Reading mapping file of the data
df1 = pd.read_csv('UNSW-NB15_1.csv') # reading first file of data
df2 = pd.read_csv('UNSW-NB15_2.csv') # reading second file of data
df3 = pd.read_csv('UNSW-NB15_3.csv') # reading third file of data
df4 = pd.read_csv('UNSW-NB15_4.csv') # reading fourth file of data
```

Figure 8: Raw Data

We printed all the features from the features.csv file Figure 9 and displayed sample data from the first CSV file, df1, using the head and tail commands please refer to the Figure 10 for details.

```
In [48]: print('Features for this data is:') # printing different features in data along with their meaning
features

Features for this data is:

Out [48]:
```

No.	Name	Type	Description	
0	1	srcip	nominal	Source IP address

Figure 10: head and tail of the data

As the above data lacks headers, we added headers to all four CSV files, combined the data, and printed a sample with headers. Additionally, we provided an overview of the data, including the number of columns and rows. Furthermore, we printed the "label" data along with the count of 0's and 1's can be seen at Figure 11

```
In [53]: df_f = pd.concat([df1, df2, df3, df4], axis=0)      # concating the all data

In [54]: df_f.head()      # visualisng the data after concating to assure the correct concatination
Out[54]:

Figure 12: Removing Duplicate data

We replaced missing values in the 'attack-cat' column with 'normal', substituted '-' with 'none', performed a fundamental transformation of IP addresses to decimal, and checked for null values. Figure 13

```
In [28]: def ip_to_decimal(ip):
if isinstance(ip, int):
return ip # If already an integer, return it as is
octets = ip.split('.')
binary = '{0:08b}{1:08b}{2:08b}{3:08b}'.format(*map(int, octets))
decimal = int(binary, 2) # Convert binary to decimal
return decimal

final_df['srcip'] = final_df['srcip'].apply(ip_to_decimal)
final_df['dstip'] = final_df['dstip'].apply(ip_to_decimal)

In [29]: # checking null values in data
print('Null values in each column are:\n', final_df.isnull().sum())

Null values in each column are:
srcip      0
sport      0
dstip      0
dsport     0
proto     0
state     0
dur        0
```

Figure 13: Checking null values

4.3 Data analysis and visualisation

After that we provided a comprehensive view of Source-to-Destination (S/D) and Destination-to-Source (D/S) transaction bytes, highlighting their majority. Additionally, we visualized the data structure using bar plots Figure 14 and displayed different attack categories with respect to labels, using both bubble scatter plots and histogram plots Figure 15

```
In [35]: # bar plot of Different Service Count with respect to Label
# Set the figure size
plt.figure(figsize=(12, 8))

# Plot the countplot with customizable figure size and bar color
sns.countplot(x='service', hue='Label', data=fina_df, palette='Set2') # You can change 'Set2' to your preferred color palette

# Set title and show the plot
plt.title('Different Service Count with respect to Label')
plt.show()
```

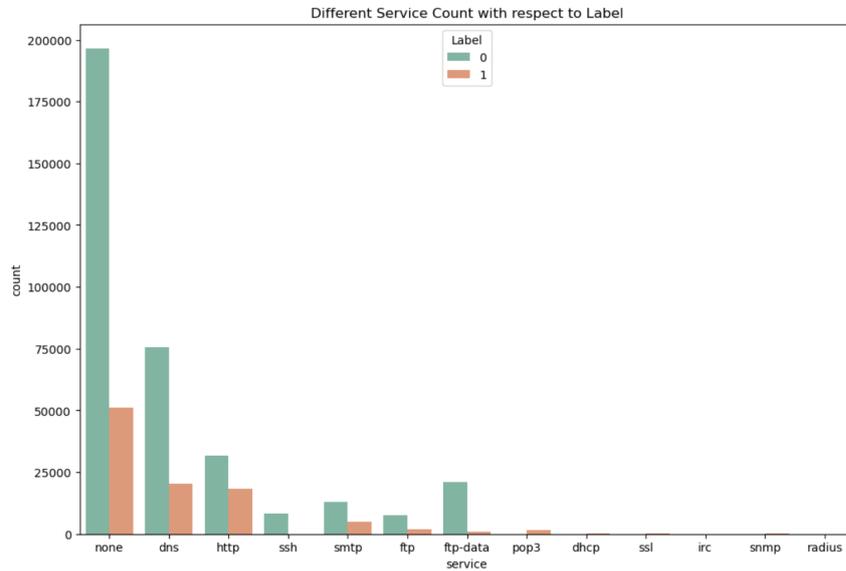

Figure 14: Bar Plot

```
In [37]: # Creating a bubble scatter plot to visualize the S/D Packet count and D/S Packets count with Attacks
# Defining a dictionary to map each label to a specific size
mapp = {
    0: 5,
    1: 15
}

fina_df['bubble_size'] = fina_df['Label'].map(mapp)

custom_colors = ['#FB2576', '#3F0071', '#FF8E00', '#00AF91']
fig = px.scatter(
    fina_df,
    x='Spkts',
    y='Dpkts',
    size='bubble_size',
    color_discrete_sequence=custom_colors,
    color='Label',
    title='S/D Packet count and D/S Packets count with Attacks'
)
fig.show()
```

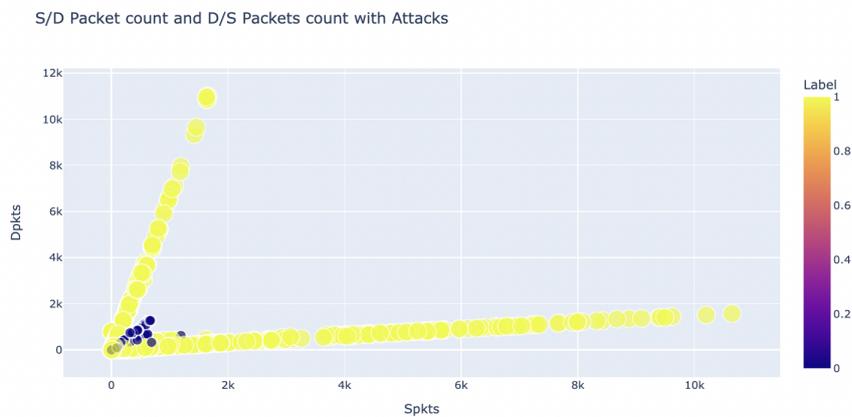

Figure 15: Bubble Scatter Plots and Histogram Plots

4.4 Feature Engineering

Feature engineering is a crucial step in optimizing the dataset for deep learning applications. Categorical columns in the dataset were transformed into numerical values using 'Label Encoding' to achieve both balanced Figure 16 and imbalanced Figure 17 representation. Please refer to the image for more details.

```
In [43]: # plotting pie plot to understand distribution of different Classes in Label column
custom_colors = ['#F45905', '#155263']
counts = final_df['Label'].value_counts()
px.pie(final_df, names=counts.index, values = counts.values, title="Label Class Count ", color_discrete_sequence=custom_
```

Label Class Count

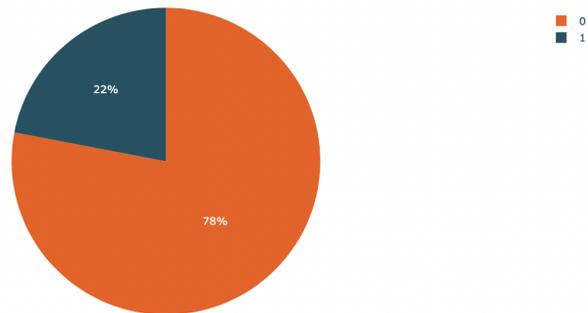

Figure 16: Imbalanced Class in Label Column

```
In [47]: ls = ['0', '1']
custom_colors = ['#F45905', '#155263']
values = new_labels.value_counts()
fig = go.Figure(data=[go.Pie(labels=ls, values=values, marker=dict(colors=custom_colors))])
fig.update_layout(title="Label Class Count After Sampling")
fig.show()
```

Label Class Count After Sampling

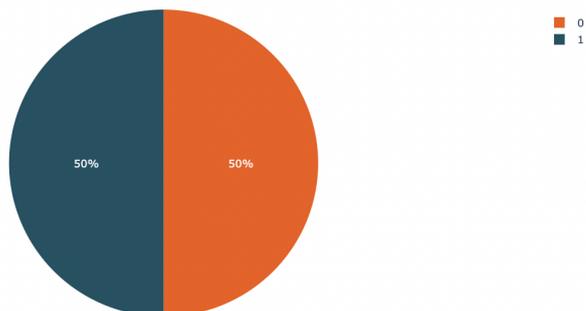

Figure 17: Balanced Class in Label Class After Sampling

To manage resources effectively and mitigate the risk of overfitting, Principal Component Analysis (PCA) was used to reduce the dimensionality of the data Figure 18

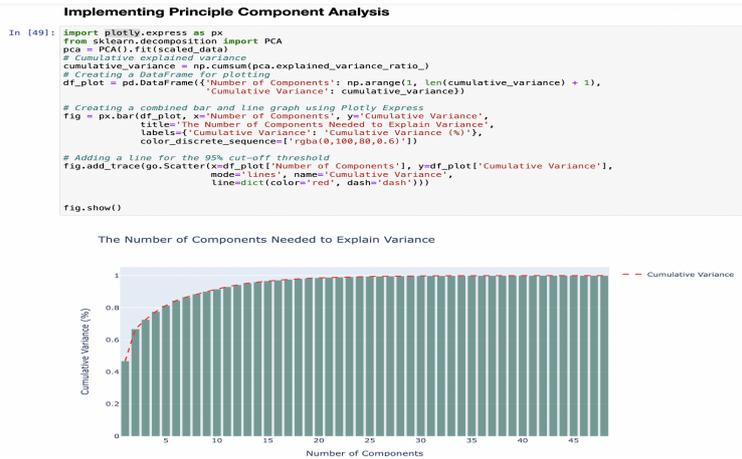

Figure 18: Principal Component Analysis

Since the 18 components capture 98 percent of the information, this not only makes computations faster but also assists the model in handling new data. This refined data is then used for training and evaluating the model, where we split it into training and test datasets. Figure 19

```

In [50]: pca_comp = PCA(n_components = 18) # 18 components are capturing 98% of Info from the data
pca_scaled_data = pca_comp.fit_transform(scaled_data) # indicates the variance of each component
print(np.sum(pca_comp.explained_variance_ratio_))
0.9800545654248592

4.5 Model Training

Here we are using 3 machine learning models Recurrent Neural Networks (RNN), Autoencoder, and Graph Neural Networks (GNN) algorithms. The training data was reshaped to maintain temporal relationships, utilizing binary cross-entropy loss and the Adam optimizer over 10 epochs with 512-sample batches to underlying patterns in the data.

Figure 22: Graph Neural Network (GNN)

4.6 Model Evaluation and Results

For model evaluation, we assessed performance using metrics such as accuracy, sensitivity, false positive rate, and specificity, offering nuanced insights into the model's ability to distinguish between normal and anomalous instances in the test data. The evaluation also included the use of the ROC-AUC curve, and based on the results, the Autoencoder demonstrated good performance Figure 24.

The 'Autoencoder ROC-AUC curve' can be seen at Figure 23. And similar execution for RNN and GNN models.

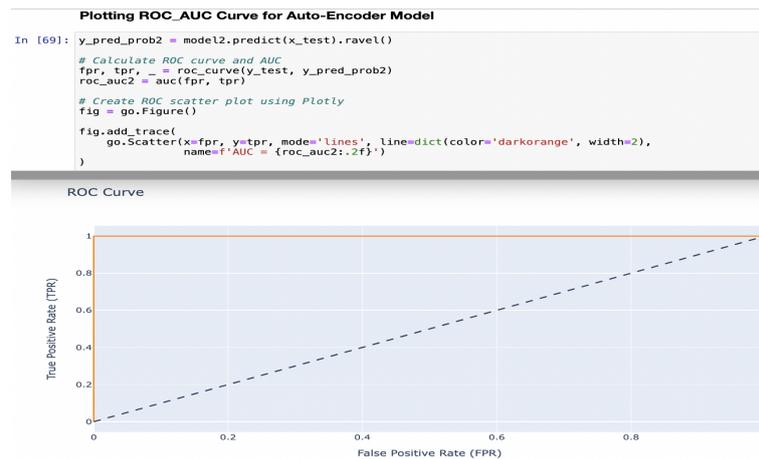

Figure 23: Autoencoder ROC-AUC curve

Figure 24: ROC-AUC-Score Comparison

4.7 Web-UI Implementation And Execution

Monitoring the cloud environment in real-time is a crucial task for timely detection and response to anomalies or attacks. We developed a web interface for live network monitoring and alerting users, employing a server-client model. The web application, developed in 'Visual Studio code' in Python Flask Figure 25 Flask is a lightweight and efficient Python web framework, and it will utilizes our 'Autoencoder' model to predict the cloud network traffic sent by the client.

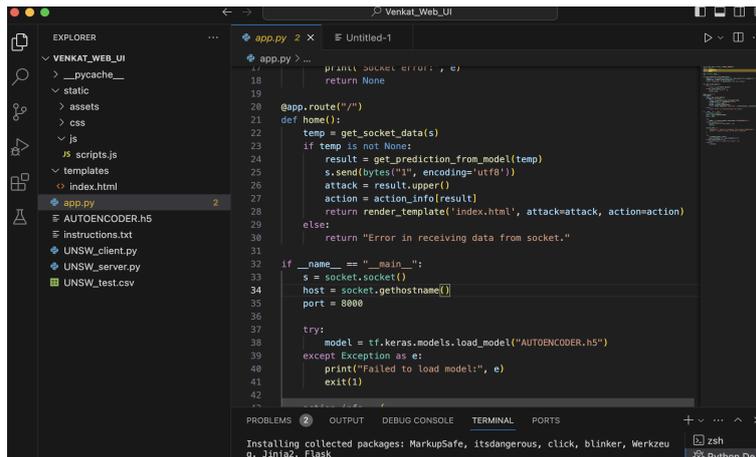

Figure 25: Visual Studio

Python socket programming was used to enable real-time data communication between the client and server, as shown in the image. The application utilizes our final model to analyze network data and provides real-time predictions of network anomalies, classifying them as 'Normal' or 'Anomalous'. Please refer to the below images for reference.

Now, follow the below steps.

1. Connect to ec2 instance via command line or putty or RDP. We need two terminals, one is to run the Client script and another is to run the application.
ssh -i "key.pem" ec2-user@ec2.aws.com
2. Copy all the files related to our Web application from 'Visual Studio' to ec2 instance and extract them Figure 26
3. In one terminal run the 'UNSW-client.py' client script Figure 29
3. In second terminal run the application file i.e 'app.py'. It will ask us to connect to the URL "http://x.x.x.x:5000" to access the application Figure 30.
4. The Client sends the packets one after the other Figure 29
5. Our Deep Learning model predicts the incoming packets. And show's a "Green Color" 31 for "Normal" and "RED Color" 32 for "Anomalous"

Figure 26 Shows the list of files in the web application

Figure 27 Shows the 'app.py' file, it has the best performing model i.e 'AUTOENCODER.h5' that will predict the incoming packets.

Figure 28 Shows the 'UNSW-client.py' client script, it will use the test data "UNSW-test.csv"

Figure 29 We are running the Client script and we can see it sending the packets to the server

Figure 30 Shows the Server receiving a response from a client

Figure: 31 32 shows the UI that we are accessing at "http://ip.address:5000" the public IP of our EC2 instance followed by port number.
