MSc Project Submission Sheet
School of Computing

Student Name: Asish Mathai Mathai
Student ID: X23173645
Programme: MSCDAD A JAN24I **Year:** 2024
Module: MSc Research Project
Lecturer: Vikas Tomar
Submission Due Date: 30/01/2025
Project Title: Enhancing Brain Tumor Detection with Deep Learning Models: A Comparative Analysis
Word Count: 936 **Page Count:** 9

I hereby certify that the information contained in this (my submission) is information pertaining to research I conducted for this project. All information other than my own contribution will be fully referenced and listed in the relevant bibliography section at the rear of the project.

ALL internet material must be referenced in the bibliography section. Students are required to use the Referencing Standard specified in the report template. To use other author's written or electronic work is illegal (plagiarism) and may result in disciplinary action.

Signature: Asish Mathai Mathai

Date: 28/01/2025

PLEASE READ THE FOLLOWING INSTRUCTIONS AND CHECKLIST

Attach a completed copy of this sheet to each project (including multiple copies)	<input type="checkbox"/>
Attach a Moodle submission receipt of the online project submission, to each project (including multiple copies).	<input type="checkbox"/>
You must ensure that you retain a HARD COPY of the project, both for your own reference and in case a project is lost or mislaid. It is not sufficient to keep a copy on computer.	<input type="checkbox"/>

Assignments that are submitted to the Programme Coordinator Office must be placed into the assignment box located outside the office.

Office Use Only

1 Connecting to a Colab Session and Drive setup

1.1.1 Setting Up Your Google Colab Session: A Quick Guide

1. **Open Google Colab**
 - Visit the Google Colab website to begin.
2. **Sign In to Your Account**
 - Log in with your Google credentials, if required.
3. **Start a New Notebook**
 - Click on the "New Notebook" button to create a blank workspace.
4. **Activate GPU Acceleration**
 - Navigate to the top menu and select **Runtime > Change runtime type**.
 - In the "Hardware accelerator" dropdown menu, choose **A100 GPU**.
 - Confirm the selection by clicking **Save**.

Now your Colab notebook is optimized with GPU acceleration, ready for high-performance computing!

1.2 Drive connection

1. **Import the drive Module and Mount Your Drive**
 - Run the following code in a Colab cell to initiate the connection:

```
from google.colab import drive
drive.mount('/content/drive')
```
2. **Authenticate Google Drive Access**
 - After running the code, a prompt will appear in the notebook.
 - Click on "Connect to Google Drive" when prompted.
3. **Sign In to Your Google Account**
 - Choose the account you wish to connect.
 - Grant Colab the required permissions by following the on-screen instructions.
4. **Verify Drive Access**
 - Once connected, your Google Drive will be mounted at /content/drive.
 - You can now access files stored in your Drive within the Colab environment.

2 Uploading Files to Google Drive

2.1 Accessing Google Drive

1. Open your web browser
2. Navigate to drive.google.com
3. Sign in with your Google account credentials

2.2 Creating Directory Structure

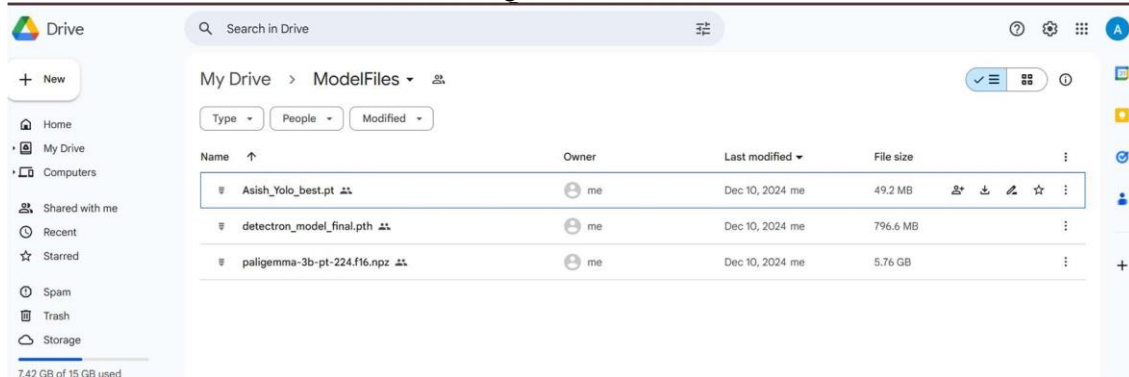

1. Click the "+ New" button in the top-left corner
2. Select "Folder" from the dropdown menu
3. Name the folder "model_files"
4. Double-click to open the new folder

2.3 Uploading Model Files

1. Inside the "model_files" folder, click the "+ New" button
2. Select "File upload" or simply drag and drop the following files:
 - o aishs_yolo.pt
 - o detectron_model_final.pth
 - o paligemma-3b-pt-224.f16.npz

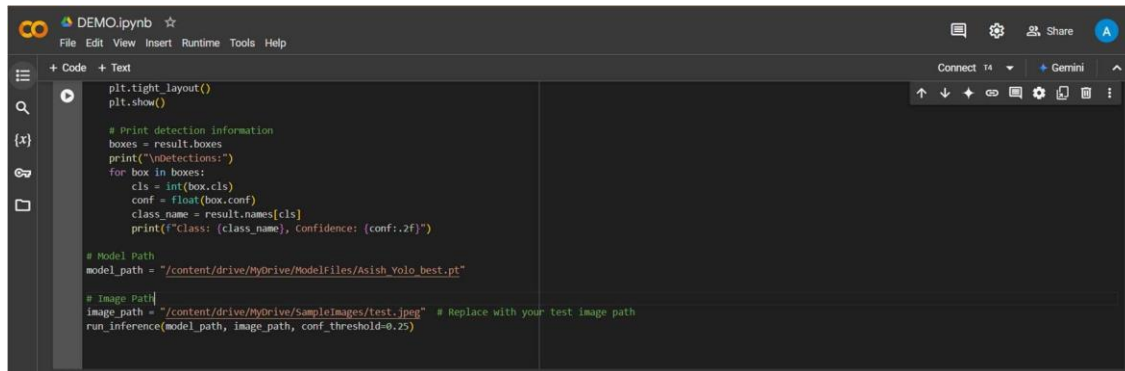

2.4 Verifying Upload

1. Wait for the upload completion notification
2. Confirm all three files are visible in the "model_files" directory
3. Check that file sizes match the original files

3 Update the Model path in the Demo.ipynb File

3.1 For YOLO

- Change the updated model path and image for the inference purpose

3.2 For the Detectron2

```
+ Code + Text
print(f" Bounding Box: [x1={box[0]:.1f}, y1={box[1]:.1f}, x2={box[2]:.1f}, y2={box[3]:.1f}]"
else:
    print("\nNo detections found above the confidence threshold.")
    print("Try lowering the confidence threshold or check if the model is properly loaded.")

except Exception as e:
    print(f"Error during inference: {str(e)}")
    import traceback
    traceback.print_exc()

# Example usage
try:
    model_path = "/content/drive/MyDrive/ModelFiles/detectron_model_final.pth"
    image_path = "/content/drive/MyDrive/SampleImages/test.jpeg"

    print(f"checking model path: {model_path}")
    print(f"checking image path: {image_path}")

    if not os.path.exists(model_path):
        print(f"Error: Model file not found at {model_path}")
    elif not os.path.exists(image_path):
        print(f"Error: Image file not found at {image_path}")
    else:
        print("All paths exist, running inference...")
        run_detectron2_inference(model_path, image_path, conf_threshold=0.1)

except Exception as e:
    print(f"An error occurred: {str(e)}")
```

- Same update the path of the model file and test image path

3.3 For the PaliGemma

```
DEMO.ipynb
File Edit View Insert Runtime Tools Help All changes saved

for img_path in image_files:
    print(f"Processing: {img_path}")
    try:
        detection = self.detect_single_image(
            image_path=img_path,
            save_visualization=True,
            output_dir=output_dir
        )
        results.append(detection)
    except Exception as e:
        print(f"Error processing {img_path}: {str(e)}")
        continue

return results

def main():
    # Configuration
    CHECKPOINT_PATH = "/content/drive/MyDrive/ModelFiles/paligemma-3b-pt-224.f16.npz"
    TOKENIZER_PATH = "/content/paligemma_tokenizer.model"
    OUTPUT_DIR = "detection_outputs"

    try:
        # Initialize detector and load model once
        print("Initializing detector and loading model...")
        detector = BrainTumourDetector(
            checkpoint_path=CHECKPOINT_PATH,
            tokenizer_path=TOKENIZER_PATH
        )
        detector.load_model()
        print("Model loaded successfully")
```

- Change the model path and tokenizer path and change the output directory if needed.

4 Running the Inference on the Trained Models

1. Section 1: YOLO

- Open Google Colab
- Install ultralytics library
- Change the following paths in your code:
 - Update model_path
 - Update image_path (Use paths from above section)
- Run the detection code

2. Section 2: Detectron2

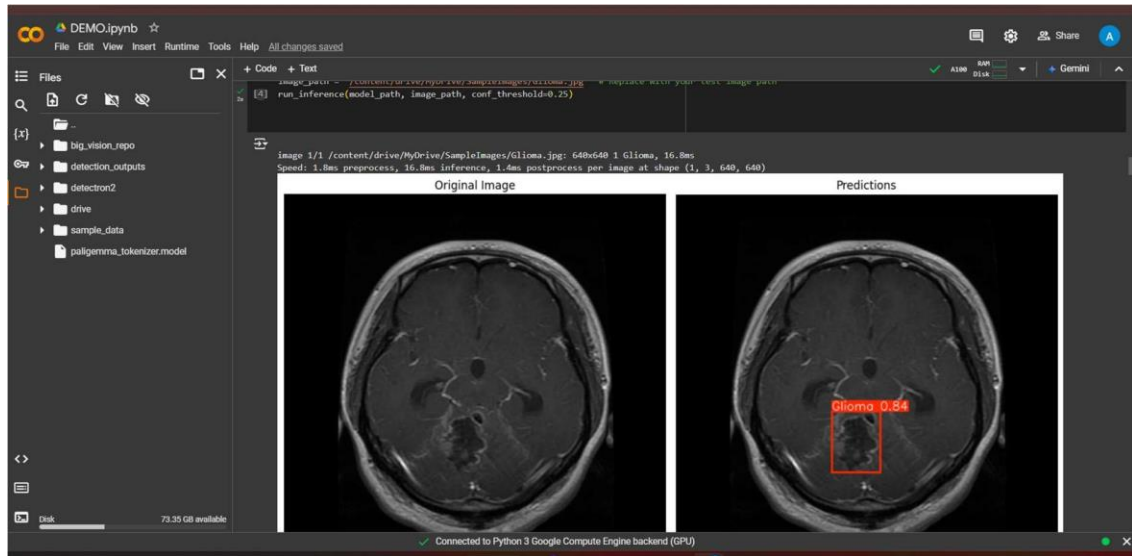

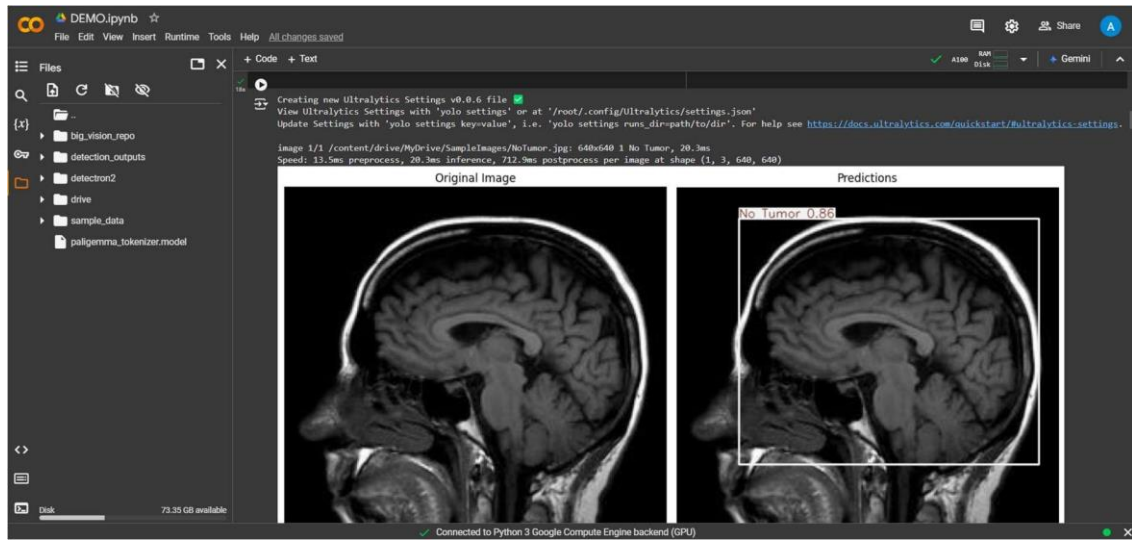

- Open Google Colab
- Install all dependencies
- Update these paths (as per above section):
 - Change model path
 - Change test image path
- Run the code

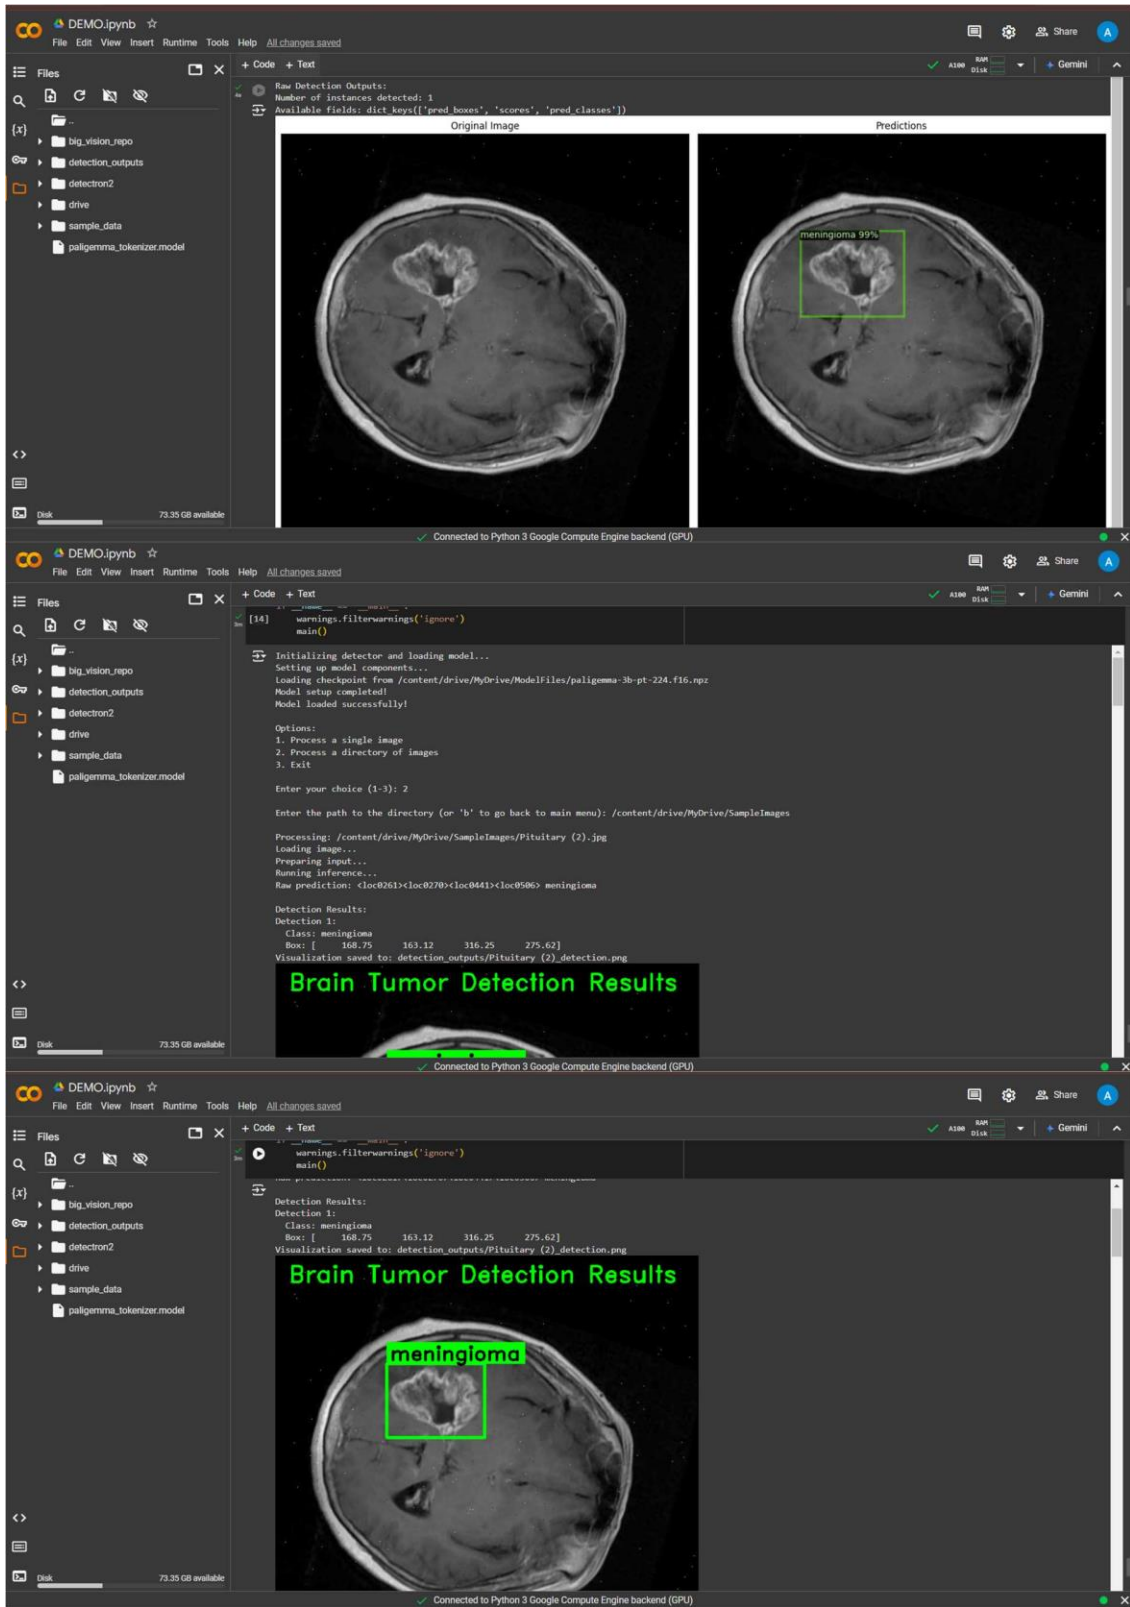

3. Section 3: Paligemma

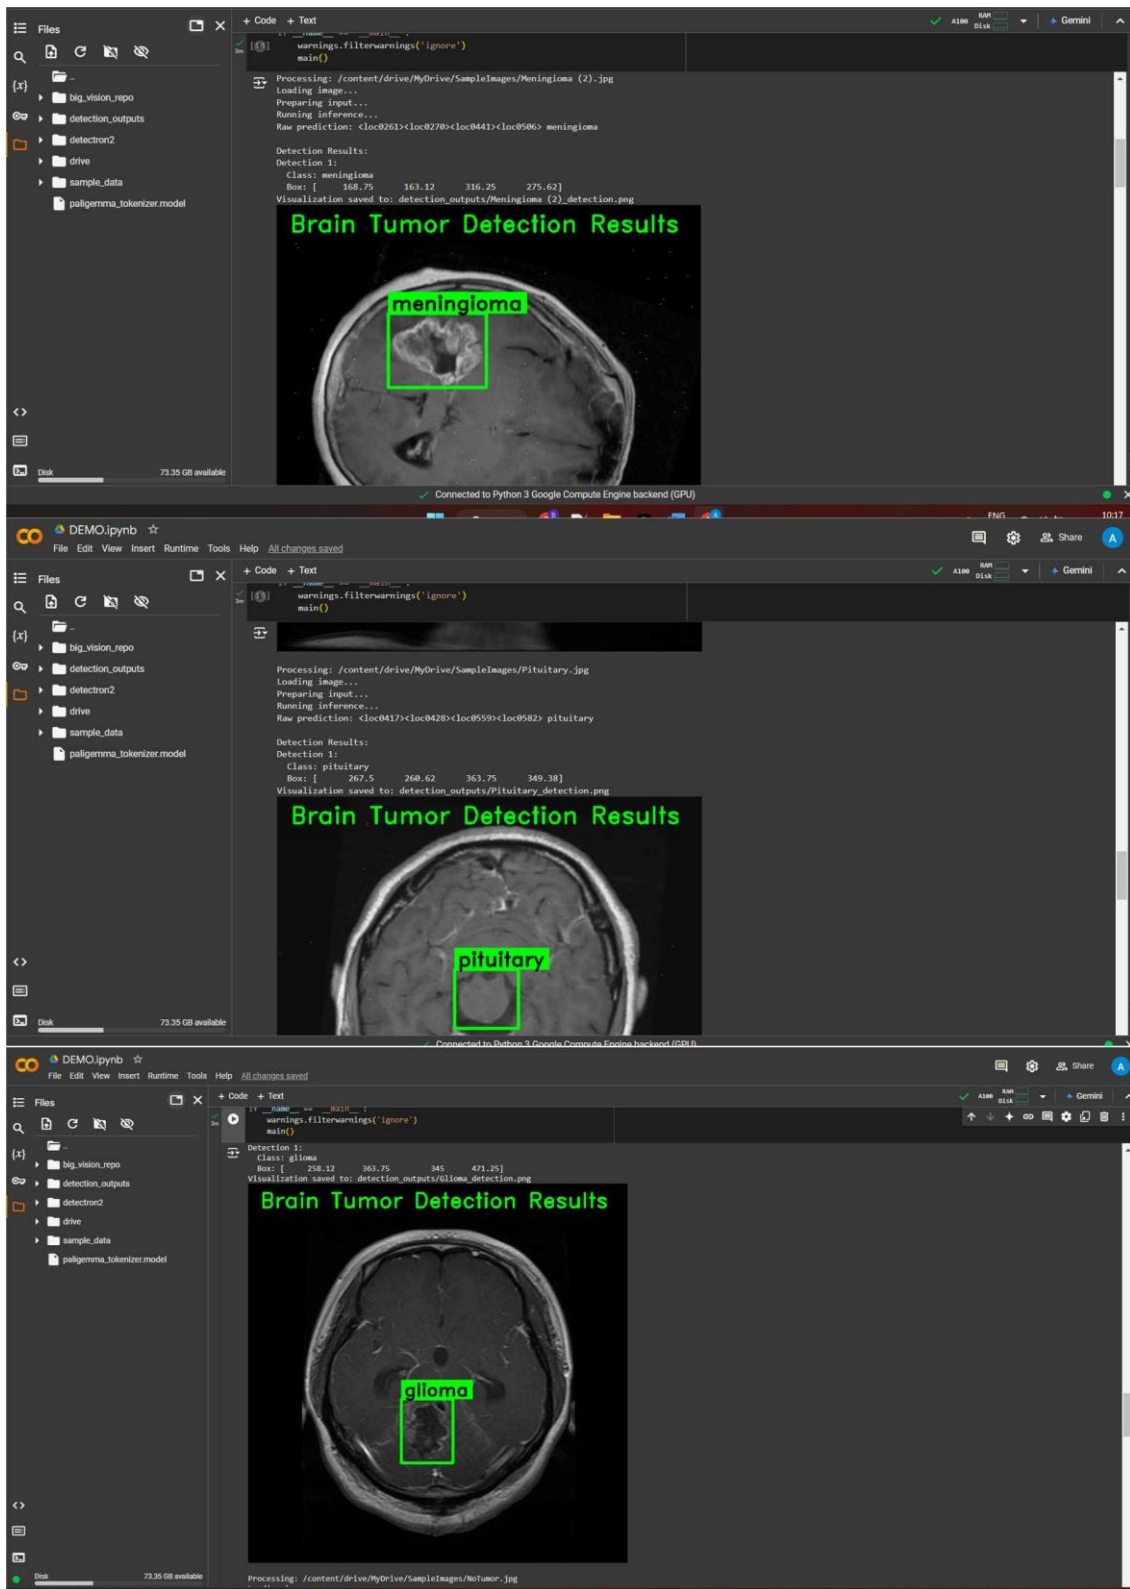

- ❖ Open Google Colab
- ❖ Install dependencies
- ❖ Update paths if needed:
 - Model path
 - Tokenizer path (Note: If using default, no need to change as it will download to same path)
- ❖ Run the code
- ❖ You will see 3 options:
 - Check on single image
 - Check on entire directory
 - Exit
- ❖ Choose option and provide required paths
- ❖ Press Enter
- ❖ After completion:
 - For directories: "Process another directory? (y/n):"
 - For images: "Process another image? (y/n):"
- ❖ Input response:
 - Enter 'y': Returns to options menu to provide new image/directory path
 - Enter 'n': Exits the program

Note: Make sure to have GPU runtime selected in your Colab notebooks for better performance.
